S1. Comparison of geometry

Table S1. A comparison of calculated geometry of TPPE with the experiment.^a

	Cal.	Exp.		
	Bond lengths (angstrom)			
C1-C2	1.367	1.352		
C2-C3	1.493	1.480-1.498		
C3-C4/C3-C8	1.406	1.387-1.403		
C4-C5/C7-C8	1.391	1.368-1.387		
C5-C6/C6-C7	1.405	1.387-1.402		
C6-C9	1.482	1.478-1.491		
C9-C10/C9-C13	1.404	1.371-1.393		
C10-C11/C12-C13	1.393	1.374-1.393		
C11-N1/C12-N1	1.341	1.311-1.339		
Dihedral Angles (degree)				
С14-С1-С2-С3 (β)	12.8	5.6		
C1-C2-C3-C4 (a)	49.9,50.0	50.7-57.3		
C5-C6-C9-C10	33.3-33.9	21.9-32.2		

^{*a*} Selected bond lengths and dihedral angles of the B3LYP/6-31G(d) equilibrium geometry in comparison to experimental data.¹

As shown in Table S1, the differences between computational and experimental bond lengths are all less than 0.02 Å which are very consistent. In the case of dihedral angle, the computational values of C1-C2-C3-C4 and C5-C6-C9-C10 are closed to that

in experiment, but the value of C14-C1-C2-C3 is larger than experiment because the molecular structure measured in experiment is in solid state which would reduce the planarity of TPPE due to the molecular stacking. In general, the calculated geometry of TPPE is consistent with the experimental result.

S2. Emission wavelength

Table S2. The emission wavelength of TPPE with α and β varying from 0° to 80°

α	Emission	β	Emission Wavelength
(degree)	Wavelength (nm)	(degree)	(nm)
0	727.68	0	466.88
10	731.37	10	466.18
20	690.95	20	472.64
30	602.16	30	488.75
40	525.66	40	516.49
50	467.18	50	563.30
60	418.42	60	645.57
70	380.59	70	807.86
80	351.73	80	1252.08

calculated at B3LYP/6-31G(d) level.

S3. Energy surface

Fig. S1 Energy surfaces of TPPE at S_0 and S_1 respectively with α (β is fixed in 12.8°) (a) or β (α is fixed in 50.0°) (b) varying from 0° to 80°. All the energies have subtracted the reference energy of the equilibrium geometry of TPPE at S_0 . These optimizations are all performed at B3LYP/6-31G(d) level.

As shown in Fig. S1, the trend of energy surfaces of S₀ and S₁ are exactly the same. The energy varies with α and β reaches a minimum at α =50° and β =13° respectively, consistent with the equilibrium geometry of TPPE at S₀ (Table S1). The molecular energy is low when α is in the 30° to 80° range ($\Delta E < 1$ eV), and it rises dramatically when α is less than 20° due to the enhanced steric hindrance effect (Fig. S1a). In the case of β , the molecular energy is increased gradually with the twisting of the ethylenic C=C bond (the increasing β) (Fig. S1b).

S4. Fitting details

Fig. S2 Linear fit of the emission energy (E_{S1}) to $\sin^2 \alpha$ and the fitting details.

Fig. S3 Linear fit of E_{S1} (a) and its reciprocal (b) to tan β with the fitting details.

S5. Comparison of emission energy

Table S3. A comparison of emission energies of TPPE calculated by Eq. (3) with the values calculated by TDDFT at B3LYP/6-31G(d) level. The energy difference is defined as $\Delta E = E_{Eq.3} - E_{TDDFT}$.

α	β	Emission energy (eV)		ΔE
(degree)	(degree)	Eq. 3	TDDFT	(eV)
0	50	0.992	1.003	-0.011
10	30	1.418	1.431	-0.013
20	0	2.068	1.971	0.097
30	20	1.988	2.055	-0.067
40	60	1.517	1.771	-0.254
50	80	0.989	0.994	-0.005
60	20	2.919	2.919	-0.00015
70	70	2.059	1.782	0.277
80	40	2.995	3.042	-0.047
90	10	3.544	3.632	-0.088

As shown in Table S3, all the energy differences are within 0.3 eV, most of them are within 0.1 eV. Only two values calculated by Eq. (3) have a sizable difference ($|\Delta E|$ > 0.25 eV) with TDDFT calculation, and they appear when β is 60° and 70° which indicate that Eq. (3) is not so accurate for the configuration with a large β . This error can be attributed to the lack of the fitting that the trigonometric function can not exactly describe the emission energy when α and β change in the whole range. However, the error of Eq. (3) is within acceptable range and it can give an accurate result when β is relatively small (less than 60°) and when either α or β is near the fitting value (their respective value in the equilibrium geometry of TPPE at S₀), such as when α =50° and β =80° (Table S3). Therefore, Eq. (3) is desirable as a quick and convenient way to predict the approximate emission energy (or wavelength) of TPPE.

S6. Absorption property

Fig. S4 Maximum absorption ability (reflected by transition oscillator strength) versus wavelength for TPPE with α (a) and β (b) varying from 0° to 80° respectively. Plots of excited energy from the S₀ to the S₁ of TPPE versus α (c) and β (d) varying from 0° to 120°.

As shown in Fig. S4, the maximum absorption wavelength is blue-shifted from 550 nm to 290 nm with increasing α , and red-shifted from 390 nm to 1000 nm with increasing β , which shows the same trend with emission properties (Fig. 2).

S7. Hole-electron distribution

Fig. S5 Hole-electron distributions of TPPE for the lowest excited state based on the equilibrium geometries at S_0 (a) and S_1 (b) respectively, and the S_1 geometry when β is 80° (α is 50°) (c). The blue and green isosurfaces represent hole and electron distributions, respectively. The analyses are performed by the Multiwfn software² based on the TDDFT calculations at B3LYP/6-31G(d) level.

As shown in Fig. S5, the distributions of hole and electron for the lowest excited state of TPPE are not separated from each other whether in the S₀ or S₁ geometries, and the same in an extremely twisted geometry (β =80°). Therefore, there no appreciable charge transfer property was found in the lowest excited state of TPPE.

S8. Molecular orbital energy

Fig. S6 Molecular orbital energies of TPPE at successively increasing values of α (a) or β (b) based on the optimization geometries of the S₁ which are calculated at B3LYP/6-31G(d) level. Here HOMO (LUMO) represents the highest occupied molecular orbital (lowest unoccupied molecular orbital).

As shown in Fig. S6, the energy of HOMO is increased and the energy of LUMO is decreased with the decreasing α and increasing β respectively, and leading to the reduction of energy gap. The energy changes of other molecular orbitals are all small.

S9. Solvent effect

Solvent	α	β	Maximum absorption	
(Dielectric constant)	(degree)	(degree)	wavelength (nm)	
Hexane (1.88)	48.80	12.73	395.54	
Toluene (2.37)	48.92	12.73	396.90	
CHCl ₃ (4.71)	49.61	12.82	395.59	
THF (7.52)	49.81	12.82	395.02	
CH ₂ Cl ₂ (8.93)	49.89	12.81	395.16	
MeOH (32.6)	50.15	12.85	393.81	
H ₂ O (78.4)	50.23	12.86	393.72	

Table S4. The values of α,β and the maximum absorption wavelength of TPPE in each

solvent based on the optimized geometries at S_0 calculated at B3LYP/6-31G(d) level.

Table S5. The values of α , β and the emission wavelength of TPPE in each solvent

Solvent	α	β	Emission wavelength
(Dielectric constant)	(degree)	(degree)	(nm)
Hexane (1.88)	24.05	54.97	763.51
Toluene (2.37)	24.04	55.39	767.96
CHCl ₃ (4.71)	23.56	57.16	799.10
THF (7.52)	23.57	57.40	795.41
CH_2Cl_2 (8.93)	23.57	57.48	802.70
MeOH (32.6)	23.59	57.73	800.07
H ₂ O (78.4)	23.60	57.80	801.00

based on the optimized geometries at S_1 calculated at B3LYP/6-31G(d) level.

Fig. S7 Transition orbital energies with wavefunctions of the lowest excited state based on the equilibrium geometries of S_0 (a) and S_1 (b) respectively, and emission ability (reflected by transition oscillator strength) versus wavelength for TPPE with α (c) and β (d) varying from 0° to 80° respectively, calculated at PBE0/6-31G(d) level.

As shown in Fig. S7a and b, the transition energies of the lowest excited state in S₀ (3.20 eV) and S₁ geometries (1.57 eV) are both very closed to the values calculated at B3LYP level (3.14 eV for S₀ and 1.54 eV for S₁), and the wavefunctions of HOMO and LUMO are also exactly the same (Fig. 1c and d). The emission properties varying with α and β (Fig. S7c and d) show the same trend with that calculated at B3LYP level (Fig. 2b and c) in addition to a small blueshift (6-20 nm) which is attributed to the intrinsic difference between the two functionals on dealing with the exchange-correlation contribution. In general, the fully consistent transition orbitals and emission relationship indicate that the results calculated by B3LYP is reliable for this system.
