Section 4. Charge Translocation Calculations and Solvent Effects

To further explore the properties of **1-3** in the excited state, a charge translocation calculation was performed based on Mulliken charge population and an appropriate fragment partition strategy. As shown in Figure S4-1, the phenyl ring is defined as part 1, while the rest moiety of the NH_3 group is defined as part 2. The charge distributions were obtained using a full Mulliken population analysis at the CASPT2//CASSCF level of theory. Table S4-1 present the Mulliken charge distributions of parts 1 and 2 in the ground (S_0) and $S_{\text{CT}}(^1\pi\sigma^*)$ state upon the photo-excitation of **1-3**. {Charge translocation: oxenium ion(part2-part1)- S_0 (part2-part1)}/2

Figure S4-1. The scheme of fragment partition for charge translocation calculation is shown in which the phenyl ring is defined as part 1, while the rest moiety of the NH_3 group is defined as part 2.

Table S5-6 The absolute energies (A. E.) in Hartree and relative energies (R.E.) in kcal/mol for the three-dimensional PESs of para, ortho nucleophilic (a, b) and radical (c, d) addition reactions for parent molecule 1 respectively were computed along the concerted (red line) and stepwise (black line) pathways at the CASPT2//CASSCF(8,7)/6-31G** level of theory. The corresponding energy profiles are plotted in Figure 4 of the main article.
