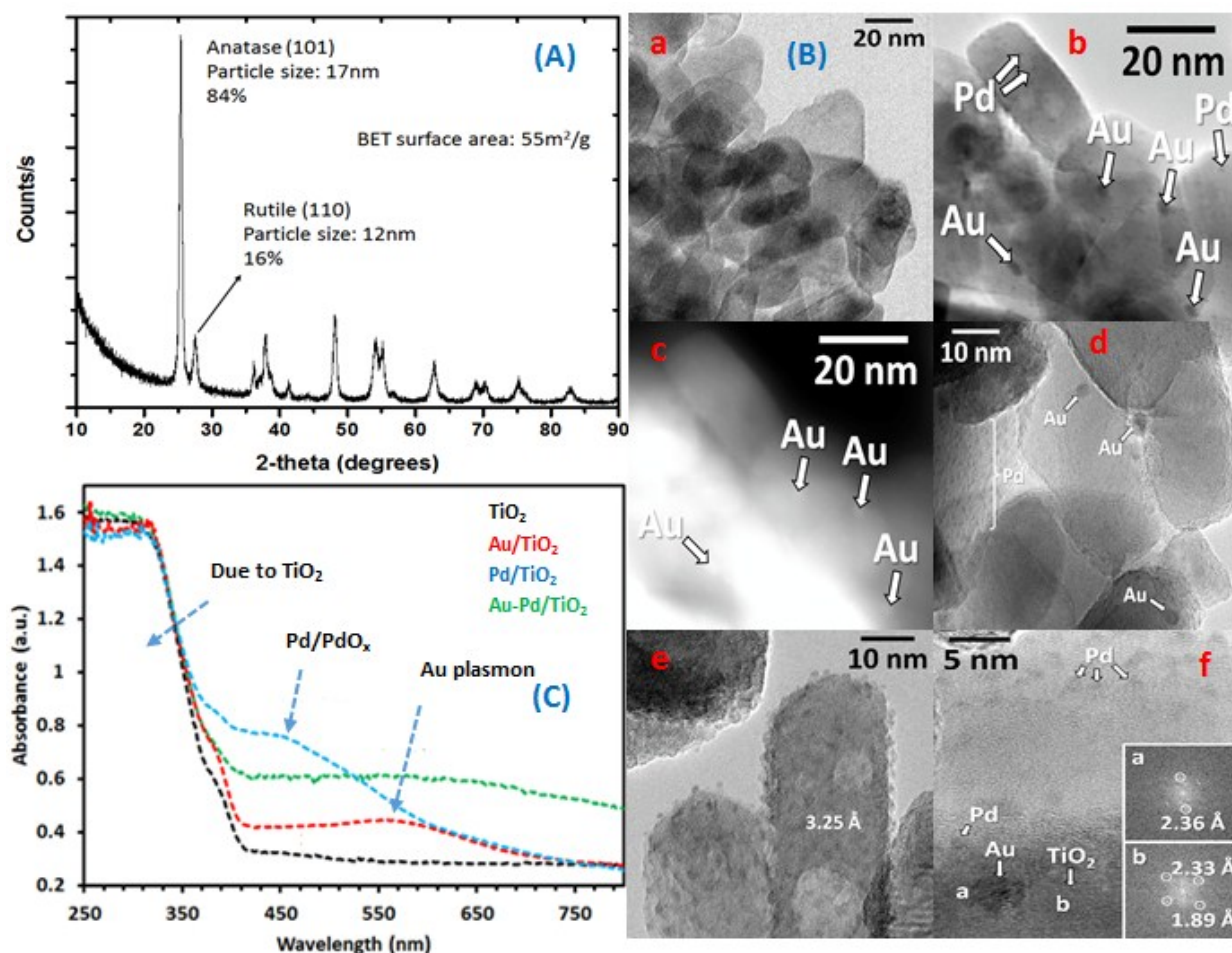

Figure SI-1:

(A) (a) Low Resolution TEM image of TiO₂ (A+R) particles (b) TEM image of 0.13 wt.% Au- 0.2 wt.% Pd/TiO₂ particle (c) combined BF and HAADF images in STEM mode of Au-Pd/TiO₂ (d, e and f) HRTEM images of Au-Pd/TiO₂ (inset show FT of Au and Pd).

(B) XRD pattern of TiO₂ (A+R) powder.

(C) UV-Vis spectra of TiO_2 and M/TiO_2 ($\text{M} = 1.2 \text{ wt.}\% \text{ Au}$, $2.0 \text{ wt.}\% \text{ Pd}$ and $3.2 \text{ wt.}\% \text{ Au-Pd}$)

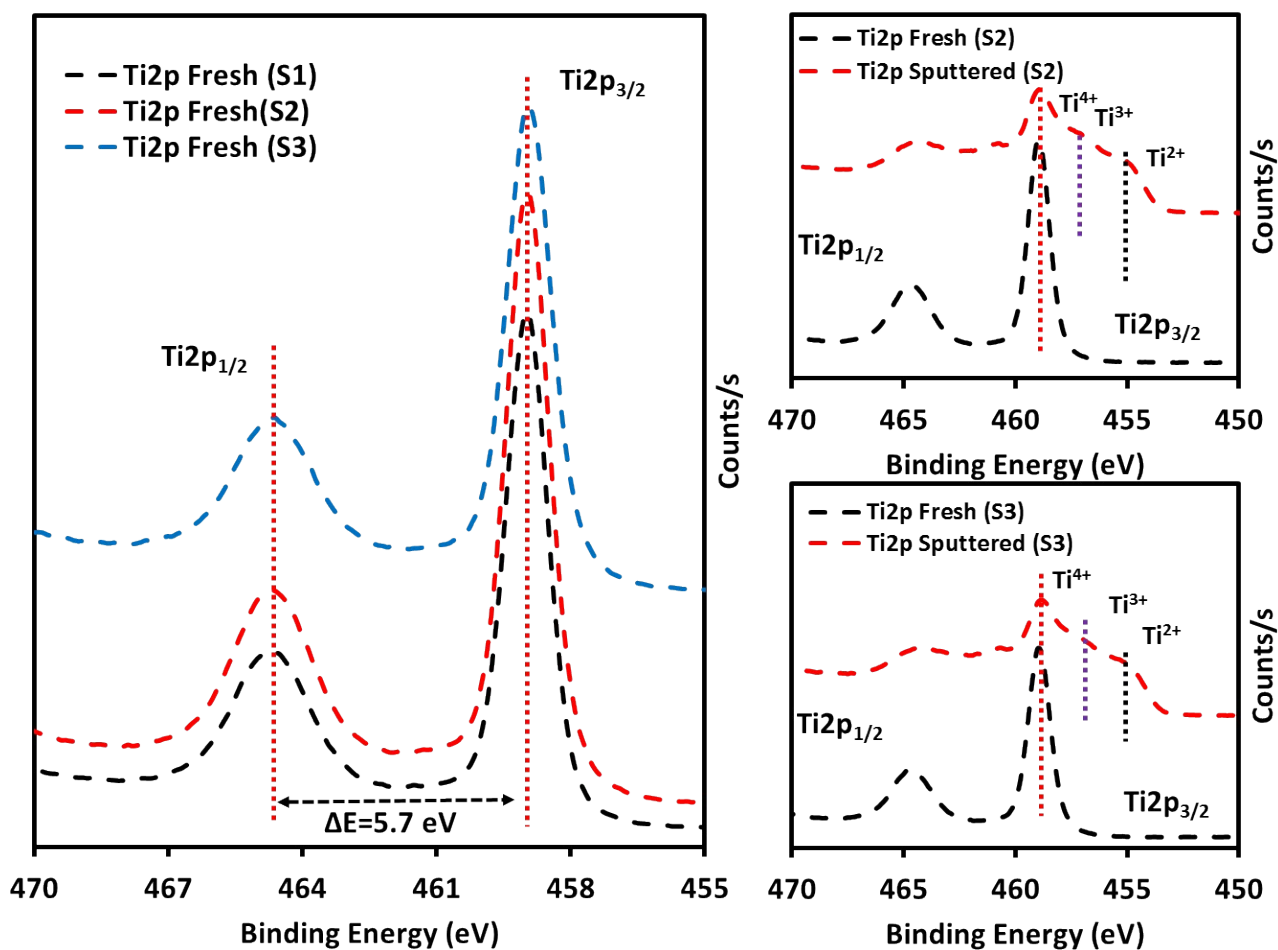

Figure SI-2:

XPS of Ti2p; before ion sputtering (fresh) and after 5 min Ar^+ -sputtering of Au-Pd/TiO_2 . Samples S1 (1.2 wt.% Au; 2.0 wt.% Pd), S2 (0.13 wt.% Au; 0.2 wt.% Pd) and S3 (0.06 wt.% Au; 0.1 wt.% Pd)

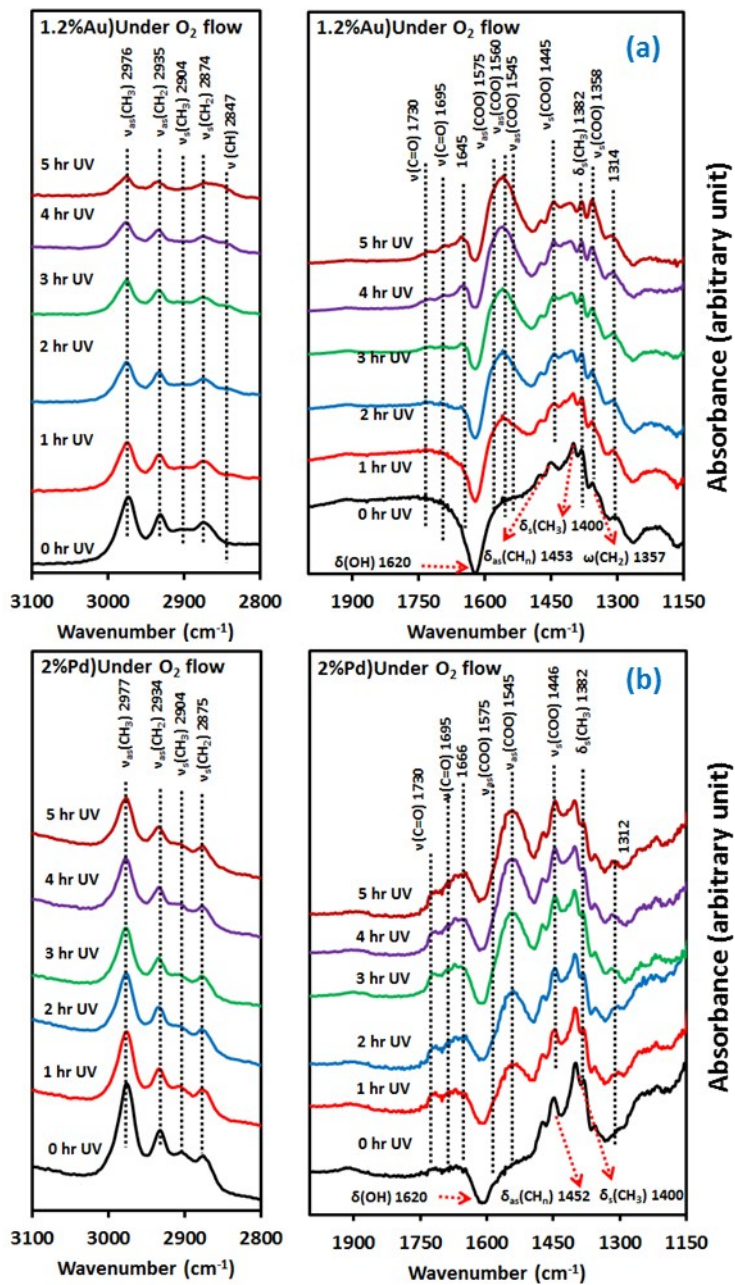

Figure SI-3:

FTIR spectra during the photo-reaction of ethanol in the presence of O₂ over (a) 1.2 wt.% Au/TiO₂ and (b) 2.0 wt.% Pd/TiO₂.

The surface was initially saturated with ethanol at 300 K, O₂ flow = 30 mL/min, P = 1 atm

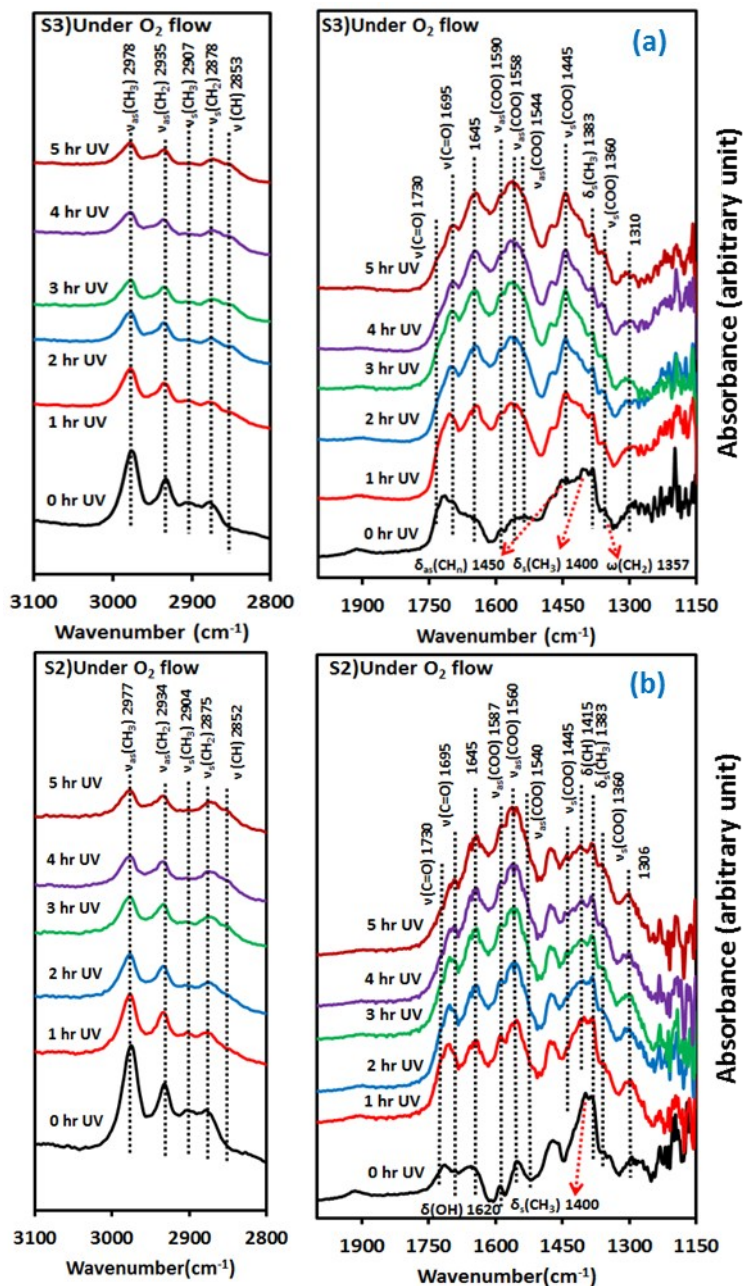

Figure SI-4:

FTIR spectra during the photo-reaction of ethanol in the presence of O₂ over (a) sample S2 (0.13 wt.% Au-0.2 wt.% Pd/TiO₂) and (c) sample S3(0.06 wt.% Au-0.10 wt.% Pd/TiO₂).

The surface was initially saturated with ethanol at 300 K, O₂ flow = 30 mL/min, P = 1 atm

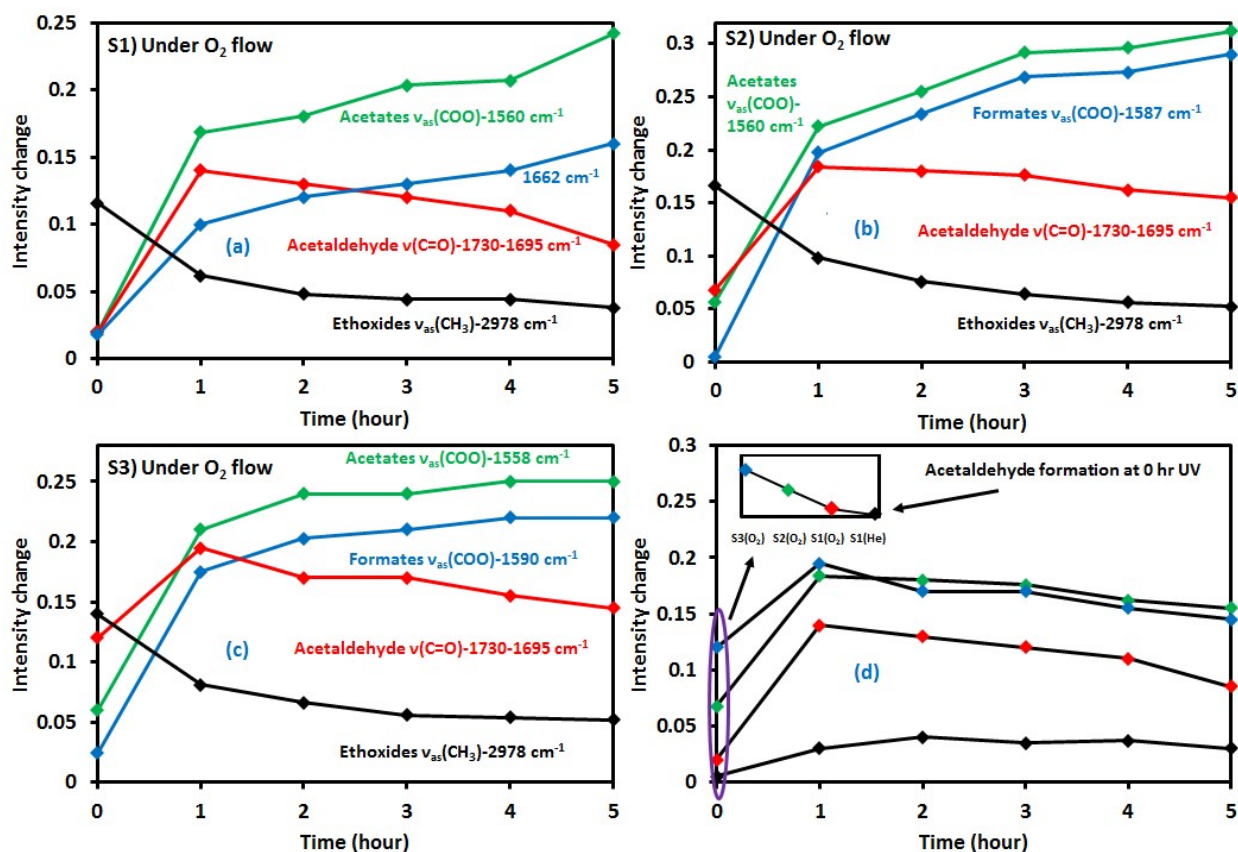

Figure SI-5:

Change in the IR intensity of species during the photo-reaction of ethanol in the presence of O₂ over Au-Pd/TiO₂ samples (a) S1, (b) S2 and (c) S3.

(d) Comparison of the acetaldehyde IR intensity change (ν C=O) with time during photo-reaction of ethanol over samples S1(under He and O₂), S2 (under O₂) and S3 (under O₂). The inset shows the formation of acetaldehyde after dark reaction (before photo-excitation) at 300 K.

Figure SI-6:

IR spectra of different concentration of ethanol on TiO₂ (A+R) collected under vacuum (1×10^{-3} Torr).

Calculation of dissolved concentration of reaction products during photo-reforming of ethanol

The calculations are done using Dalton's law of partial pressure, Raoult's law and the Henry's law.

- According to Dalton's law of partial pressure

$$P_T = P_{H_2} + P_{CO_2} + P_{CH_3CHO} + P_{CH_4} + P_{C_2H_5OH} + P_{H_2O} + P_{N_2}$$

Where P_T = Total pressure of a mixture of gases; P_{H_2} , P_{CO_2} , P_{CH_3CHO} , P_{CH_4} , $P_{C_2H_5OH}$, P_{H_2O} and P_{N_2} are the partial pressures of components inside the reactor.

- According to Raoult's law

$$P_T = P_{C_2H_5OH} + P_{H_2O}$$

$$= x_e * VP_e + x_w * VP_w$$

Where x_e and x_w are mole fractions of ethanol and water, VP_e and VP_w are the vapor pressures of ethanol and water at 300 K.

- According to Henry's law

$H^{cp} = C_a/P_i$ where H^{cp} = Henry's law constant ($\text{mol.dm}^{-3}.\text{atm}^{-1}$); C_a = Concentration of a species in the aqueous phase (mol.dm^{-3}) and P = Partial pressure of that species in the gas phase under equilibrium conditions (atm)ⁱ.
