## Experimental Details

### General Considerations.

All manipulations were carried out in the absence of water and oxygen in a UniLab MBraun inert atmosphere glovebox under a dinitrogen atmosphere. Glassware was oven dried for a minimum of 4 hrs and cooled in an evacuated antechamber prior to use in the drybox. Anhydrous methanol was purchased from Sigma-Aldrich and stored over activated 4 Å molecular sieves purchased from Fisher Scientific. All other solvents were dried and deoxygenated on a Glass Contour System (Pure Process Technology, LLC) and stored over activated 3 Å molecular sieves purchased from Fisher Scientific.  $\text{Ti}(\text{OCH}_3)_4$ ,  $\text{Zr}(\text{O}^t\text{Bu})_4$ ,  $\text{Hf}(\text{O}^t\text{Bu})_4$ , and  $^t\text{BuNBH}_4$  were purchased from Sigma-Aldrich and used as received.  $\text{VO}(\text{OCH}_3)_3$  was synthesized according to literature precedent.<sup>1</sup> Complexes **1-V<sub>6</sub>O<sub>7</sub>** and **2-V<sub>5</sub>FeClO<sub>4</sub>** were prepared according to literature procedures.<sup>2,3</sup>

<sup>1</sup>H NMR spectra were recorded at 500 on Bruker DPX-500 spectrometer locked on the signal of deuterated solvents. All chemical shifts were reported relative to the peak of residual <sup>1</sup>H signal in deuterated solvents.  $\text{CDCl}_3$  was purchased from Cambridge Isotope Laboratories, degassed by three freeze–pump–thaw cycles, and stored over activated 4 Å molecular sieves. Infrared (FT-IR, ATR) spectra of complexes were recorded on a Shimadzu IRAffinity-1 Fourier Transform Infrared Spectrophotometer and are reported in wavenumbers ( $\text{cm}^{-1}$ ). Electronic absorption measurements were recorded at room temperature in anhydrous acetonitrile in a sealed 1 cm quartz cuvette with an Agilent Cary 60 UV-Vis spectrophotometer. Mass spectrometry analyses were performed on an Advion expression<sup>L</sup> Compact Mass Spectrometer equipped with an electrospray probe operating in negative ion mode (–ve) with an ion-trap mass analyzer. Direct injection analysis was employed in all cases with a sample solution in acetonitrile. Single crystals were mounted on the tip of a thin glass optical fiber (goniometer head) and mounted on a Bruker SMART APEX II CCD platform diffractometer for a data collection at 100.0(5) K. The structures were solved using SHELXT-2014/5<sup>4</sup> and refined using SHELXL-2014/7.<sup>5</sup> Elemental analyses were performed on a PerkinElmer 2400 Series II Analyzer, at the CENTC Elemental Analysis Facility, University of Rochester.

Cyclic Voltammograms were recorded with a CH Instruments Inc. 410c time-resolved electrochemical quartz crystal microbalance. All measurements were performed in a three electrode system cell configuration that consisted of a glassy-carbon ( $\varnothing = 3.0$  mm) as working electrode, a Pt wire as the counter electrode, and an Ag/AgCl wire as the reference electrode. All electrochemical measurements were performed at room temperature in a  $\text{N}_2$ -filled glovebox. A 0.1 M  $^t\text{Bu}_4\text{NPF}_6$  solution in dry acetonitrile was used as the electrolyte solution. All redox events were referenced against ferrocenium/ferrocene ( $\text{Fc}^+/\text{Fc}$ ) redox couple.

## Group IV POV-alkoxide Syntheses:

### *Synthesis of [Bu<sub>4</sub>N] [(VO)<sub>5</sub>O(OCH<sub>3</sub>)<sub>12</sub>TiOCH<sub>3</sub>] (4-V<sub>5</sub>TiOCH<sub>3</sub>):*

In a glovebox, VO(OCH<sub>3</sub>)<sub>3</sub> (0.450 g, 2.812 mmol) and 10 mL MeOH were charged in a 25 mL Teflon-lined Parr reactor. [Bu<sub>4</sub>N][BH<sub>4</sub>] (0.146 g, 0.568 mmol) in 4 mL MeOH was added to the solution. This mixture immediately turned dark green as gas evolved. Ti(OCH<sub>3</sub>)<sub>4</sub> (0.098 g, 0.570 mmol) was added as a solid to the reaction mixture. The Parr reactor was sealed, and the mixture heated in an oven at 100 °C for 48 hours. The Parr reactor was allowed to cool to room temperature, then returned to the glove box. A brown solution resulted, and the solvent was removed under vacuum to give a red-brown solid. This solid was washed with toluene (10 mL, 3x), and any volatiles were removed under vacuum to yield **4-V<sub>5</sub>TiOCH<sub>3</sub>** as a brown solid (0.493 g, 0.472 mmol, 84%). X-ray quality crystals were grown by making a supersaturated solution of the product in hot MeOH, filtering the solution, and cooling to -30 °C for 24 hours. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ = 1.03, 1.36, 3.14, 3.90, 13.16, 25.02 ppm. Elemental analysis Calcd (%) (MW = 1044.48): C, 33.35; H, 7.24; N, 1.34. Found: C, 33.18; H, 6.99; N, 1.31 %.

### *Synthesis of [Bu<sub>4</sub>N] [(VO)<sub>5</sub>O(OCH<sub>3</sub>)<sub>12</sub>ZrOCH<sub>3</sub>] (5-V<sub>5</sub>ZrOCH<sub>3</sub>):*

In a glovebox, VO(OCH<sub>3</sub>)<sub>3</sub> (0.450 g, 2.812 mmol) and 10 mL MeOH were charged in a 50 mL Teflon-lined Parr reactor. [Bu<sub>4</sub>N][BH<sub>4</sub>] (0.146 g, 0.568 mmol) in 4 mL MeOH was added to the solution. This mixture immediately turned dark green as gas evolved. Zr(O<sup>t</sup>Bu)<sub>4</sub> (0.222 mL, 0.570 mmol) was added to the reaction mixture. The Parr reactor was sealed, and the mixture heated in an oven at 100 °C for 48 hours. The Parr reactor was allowed to cool to room temperature, then returned to the glove box. A blue-green solution resulted, which was concentrated to half of its original volume and cooled to -30 °C for 24 hours. Blue-green crystals of **5-V<sub>5</sub>ZrOCH<sub>3</sub>** (0.293 g, 0.270 mmol, 48%) formed directly from this solution. These crystals were used for X-ray analysis. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ = 1.01, 1.35, 3.20, 3.95, 13.50, 25.56 ppm. Elemental analysis Calcd (%) (MW = 1087.83): C, 32.02; H, 6.95; N, 1.29 %. Found: C, 31.73; H, 6.76; N, 1.18 %.

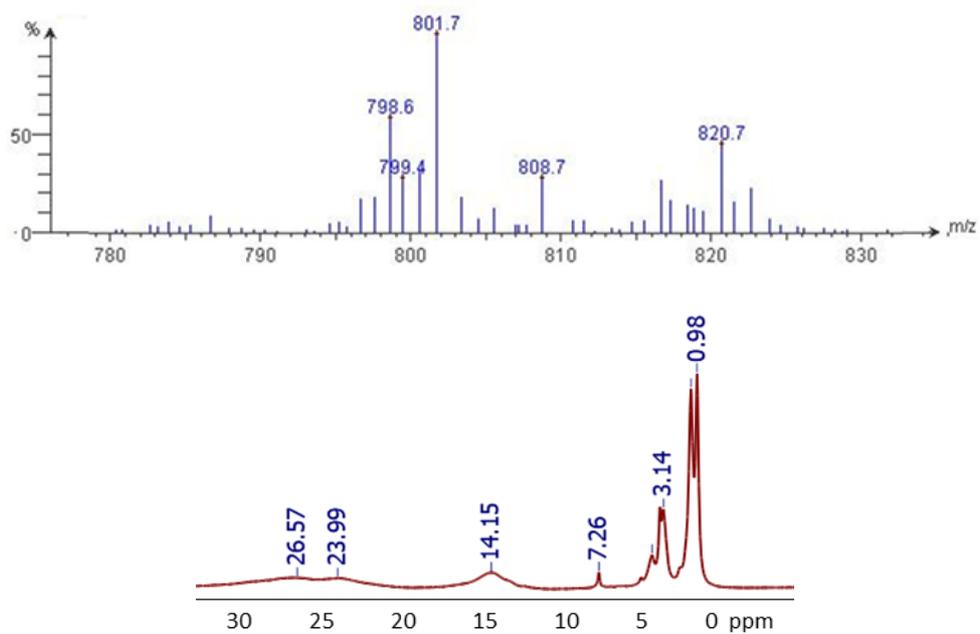

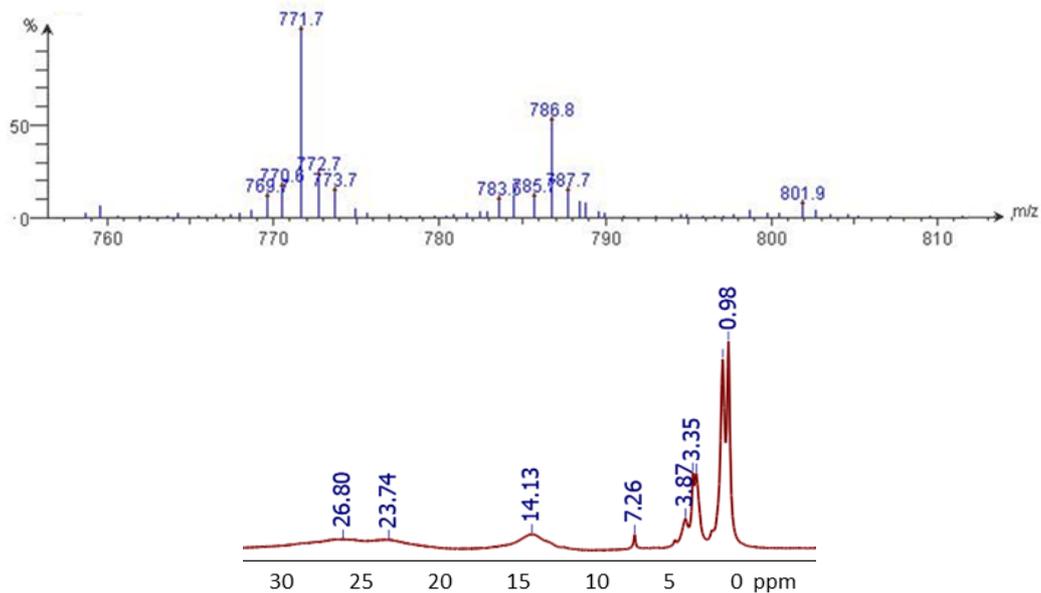

### *Synthesis of [Bu<sub>4</sub>N] [(VO)<sub>5</sub>O(OCH<sub>3</sub>)<sub>12</sub>HfOCH<sub>3</sub>] (6-V<sub>5</sub>HfOCH<sub>3</sub>):*

In a glovebox, VO(OCH<sub>3</sub>)<sub>3</sub> (0.450 g, 2.812 mmol) and 10 mL MeOH were charged in a 50 mL Teflon-lined Parr reactor. [Bu<sub>4</sub>N][BH<sub>4</sub>] (0.146 g, 0.568 mmol) in 4 mL MeOH was added to the solution. This mixture immediately turned dark green as gas evolved. Hf(O<sup>t</sup>Bu)<sub>4</sub> (0.230 mL, 0.570 mmol) was added to the reaction mixture. The Parr reactor was sealed, and the mixture heated in an oven at 100 °C for 48 hours. The Parr reactor was allowed to cool to room temperature, then returned to the glove box. A blue-green solution resulted, which was concentrated to half of its original volume and cooled to -30 °C for 24 hours. Blue-green crystals of **6-V<sub>5</sub>HfOCH<sub>3</sub>** (0.237 g, 0.202 mmol, 36%) formed directly from this solution. These crystals were used for X-ray analysis. <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ = 1.00, 1.39, 3.24, 3.99, 13.90, 26.06 ppm. Elemental analysis Calcd (%) (MW = 1175.10): C, 29.64; H, 6.43; N, 1.19. Found: C, 29.81; H, 6.57; N, 1.21 %
