

### Additional Information

**Figure S1:** MDA levels in the muscle of rats treated with goat milk lipids. Data expressed as Mean  $\pm$  DP, n = 10/group. Different letters between bars signify significant differences between groups ( $p < 0.05$ ). \*Significant differences between groups sedentary and exercised. Two-way ANOVA analysis followed by Tukey test. Control sedentary (CON) and exercised group (CON-EX); Goat milk lipids sedentary (GM) and exercised group (GM-EX); sedentary CLA (GM-CLA) and exercised group (GM-CLA-EX).
