**Supplementary Table 4.** Log<sub>2</sub>FC of gene expression between baseline and activated cell types for the M1 and M2 markers. The following datasets were used in this analysis: GSE30355 – Human keratinocytes response to injury, GSE21648 – Dermal fibroblasts, GSE7890 – Gene expression in keloid fibroblasts, GSE3037 – Neutrophils from sepsis response to LPS, GSE38396 – Endothelial cell response to type 2 diabetes, GSE39596 – T cell activation transcriptome. Genes in bold font were eliminated from the list of M1 and M2 markers. N/A indicates not included in study.

Gene	Keratinocyte	Dermal fibroblast	Keloid Fibroblast	Neutrophil	Endothelial Cell	T-cell	B-cell

GSE13896	Alveolar macrophages from smokers	Y	Y	Y	Y	N	N	Y	Y	Y

## Supplementary figures

**Supplementary Figure 1.** An example of a linear regression fit to gene expression as a function of sample composition for one of the included genes (RAMP1). In order to calculate a correlation coefficient for each gene and sample composition, the sum of the squares of the distance between each point and the line of best fit is compared to the null hypothesis that a flat horizontal line best fits the data, and the resulting ratio of the sum of square of distances from each point to the line of best fit and the horizontal line is subtracted from 1 to represent the  $R^2$  value, and the square root represents the correlation coefficient.
