^{††} present address: Department of Chemistry Box 351700, University of Washington, Seattle, Washington 98195-1700, USA

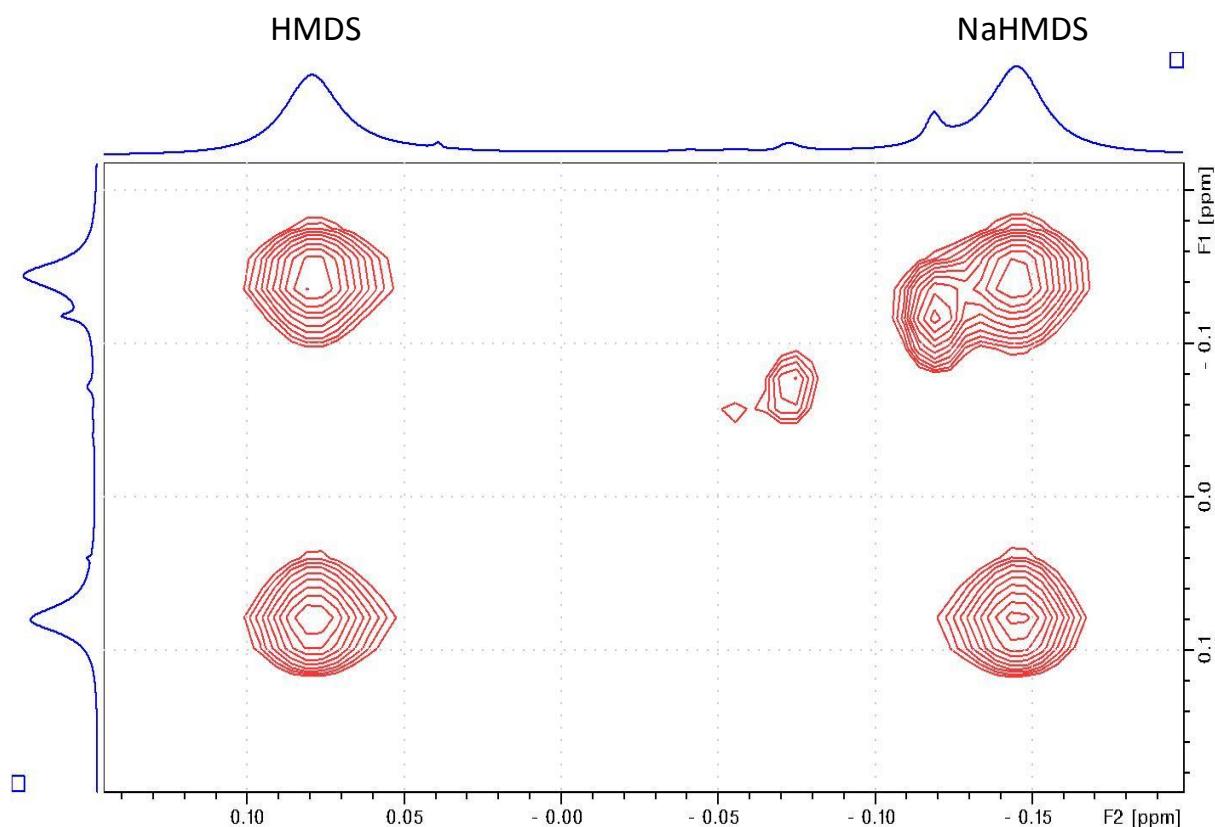

S1: Experimental WAXS data collected from the black powders obtained by evaporation of crude solutions together with a simulation from the crystalline structure (ICSD 64703) From top to bottom: BiNPs-Na, BiNPs-yne, rhombohedral Bi. NB: The crystallite size couldn't be determined with precision.

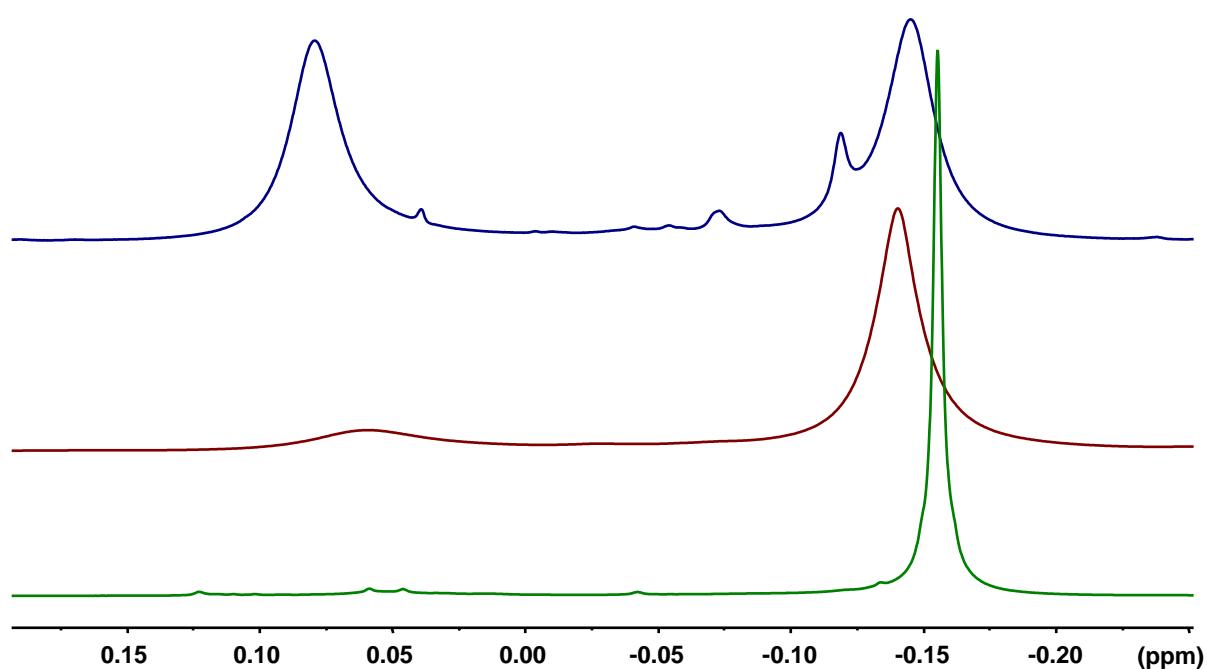

S2 : TEM image of the BiNPs-Na spontaneously precipitating from the crude solution (left) and redispersed after evaporation to dryness of the crude solution and naphthalene sublimation (right)

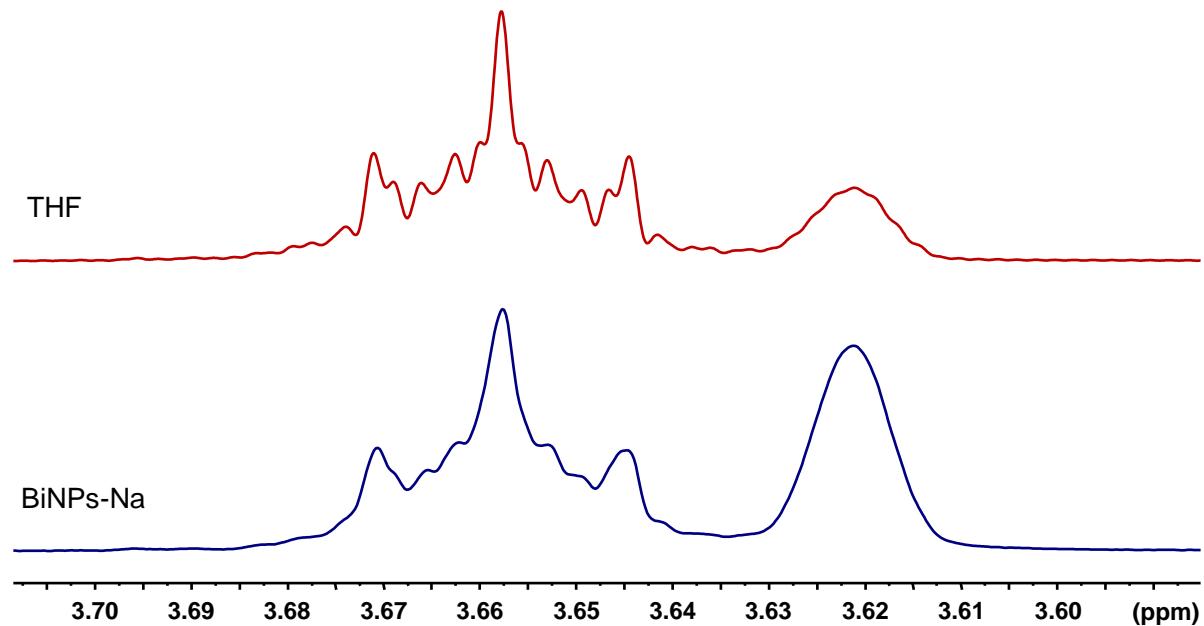

S3: ^1H (top) and $^{13}\text{C}\{^1\text{H}\}$ (bottom) NMR spectra of BiNPs-Na and comparison to control ^1H NMR spectra of NaHMDS, HMDS and naphtalene (d^8 -THF, *). (signals in the 30-40 ppm range, top spectrum : unidentified impurities)

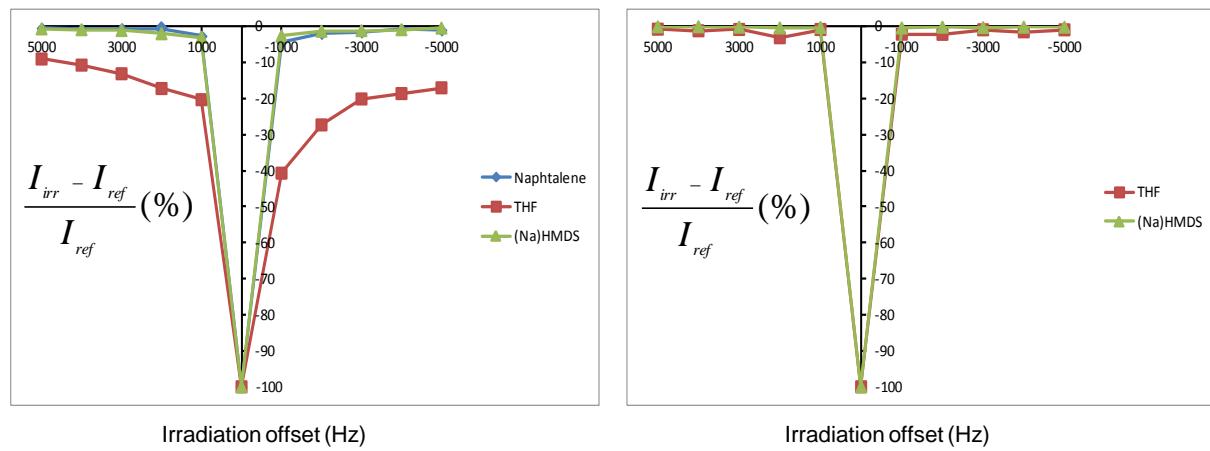

S4: ^1H ROESY NMR spectrum (mixing time 100ms) of BiNPs-Na in THF-d_8 at 296K.

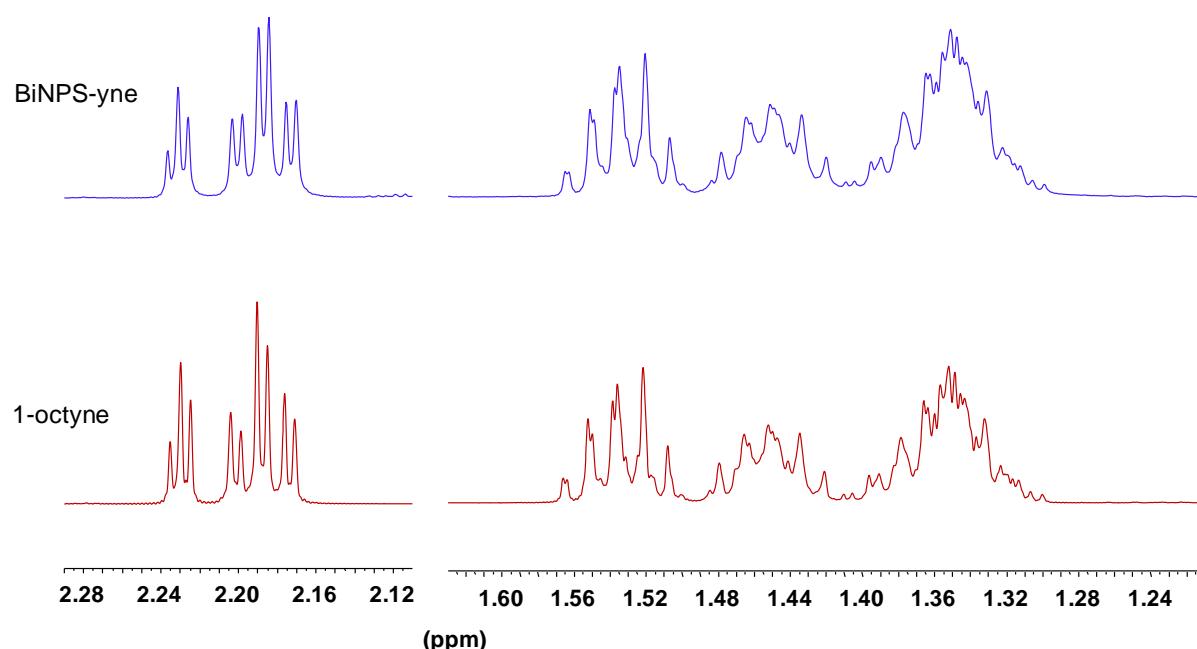

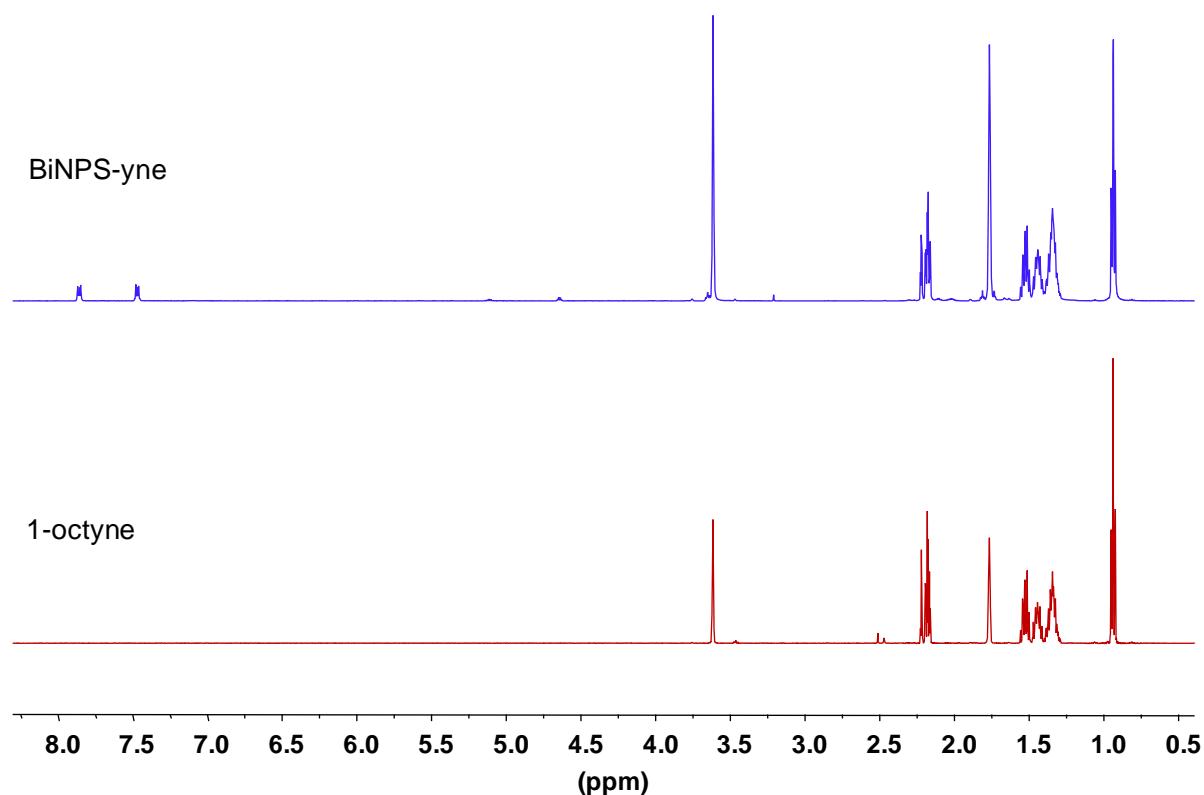

S5: ^1H NMR spectra of BiNPs-Na sample in THF-d₈ with different ratios of HMDS/NaHMDS molecules. (green line: NaHMDS, red line: + 0.2eq. HMDS, blue line: + 0.8eq. HMDS)

S6: Enlargement of the most unshielded THF resonance in the ^1H NMR spectra of the BiNPs-Na sample or of a THF solution (in THF-d₈).

S7: (left) STD NMR results for BiNPs-Na in THF-d₈ obtained by shifting selective irradiation from on-resonance to ± 5000 Hz offsets in increments of 1000 Hz. In each experiment, the intensities of naphthalene, (Na)HMDS and THF resonances were measured (I_{irr}) and compared to the ones of an off-resonance reference irradiation at $\delta=20\text{ppm}$ (I_{ref}). (Right) reference STD experiment performed on a (Na)HMDS in THF-d₈ solution with exactly the same parameters as for the BiNPs-Na sample.

S8 : Top: Full ^1H NMR spectra of 1-octyne and BiNPs-yne in THF (after purification, only limited traces of residual naphtalene can be observed in the 7-8ppm region). Bottom: Enlargement of octyne ^1H resonances.
