Competition Experiments

Competition experiments for the reaction of aldehydes **3a-e** were performed as follows. A round bottom flask containing freshly prepared lead filings (0.3 mmol) and dry dichloromethane (5 mL) was charged with Bu₄NBr (0.6 mmol), *N*-benzhydrylidene-*N*-methylamine **11** (0.15-0.25 mmol), the competing pair of aldehydes (1-2.5 mmol in 1:1-2.5 mol ratio), CF₂Br₂ (0.6 mmol), and 2-methylnaphthalene (the internal standard). The flask was tightly stoppered, immersed into the thermostat bath and the reaction mixture was vigorously stirred by magnetic stirrer at 40 °C. After the reaction started, as evidenced by clouding of the solution, small samples were periodically removed for ¹H NMR analysis. While the aldehydes **3a-e** covered a wide range of σ values, to guarantee no aldehyde would react exclusively in the competition experiments, pairs of aldehydes were selected that were close in reactivity (Table 1). Relative constants were calculated using $k_1/k_2 = [H_1] \cdot [A_2]/[H_2] \cdot [A_1]$ for experiments where the conversion of the starting aldehydes was less than 10%. The [H_i] data were obtained via integration of the 5-H singlet of the product, and [A_i] data were obtained via integration of the aldehyde proton before the reaction started.

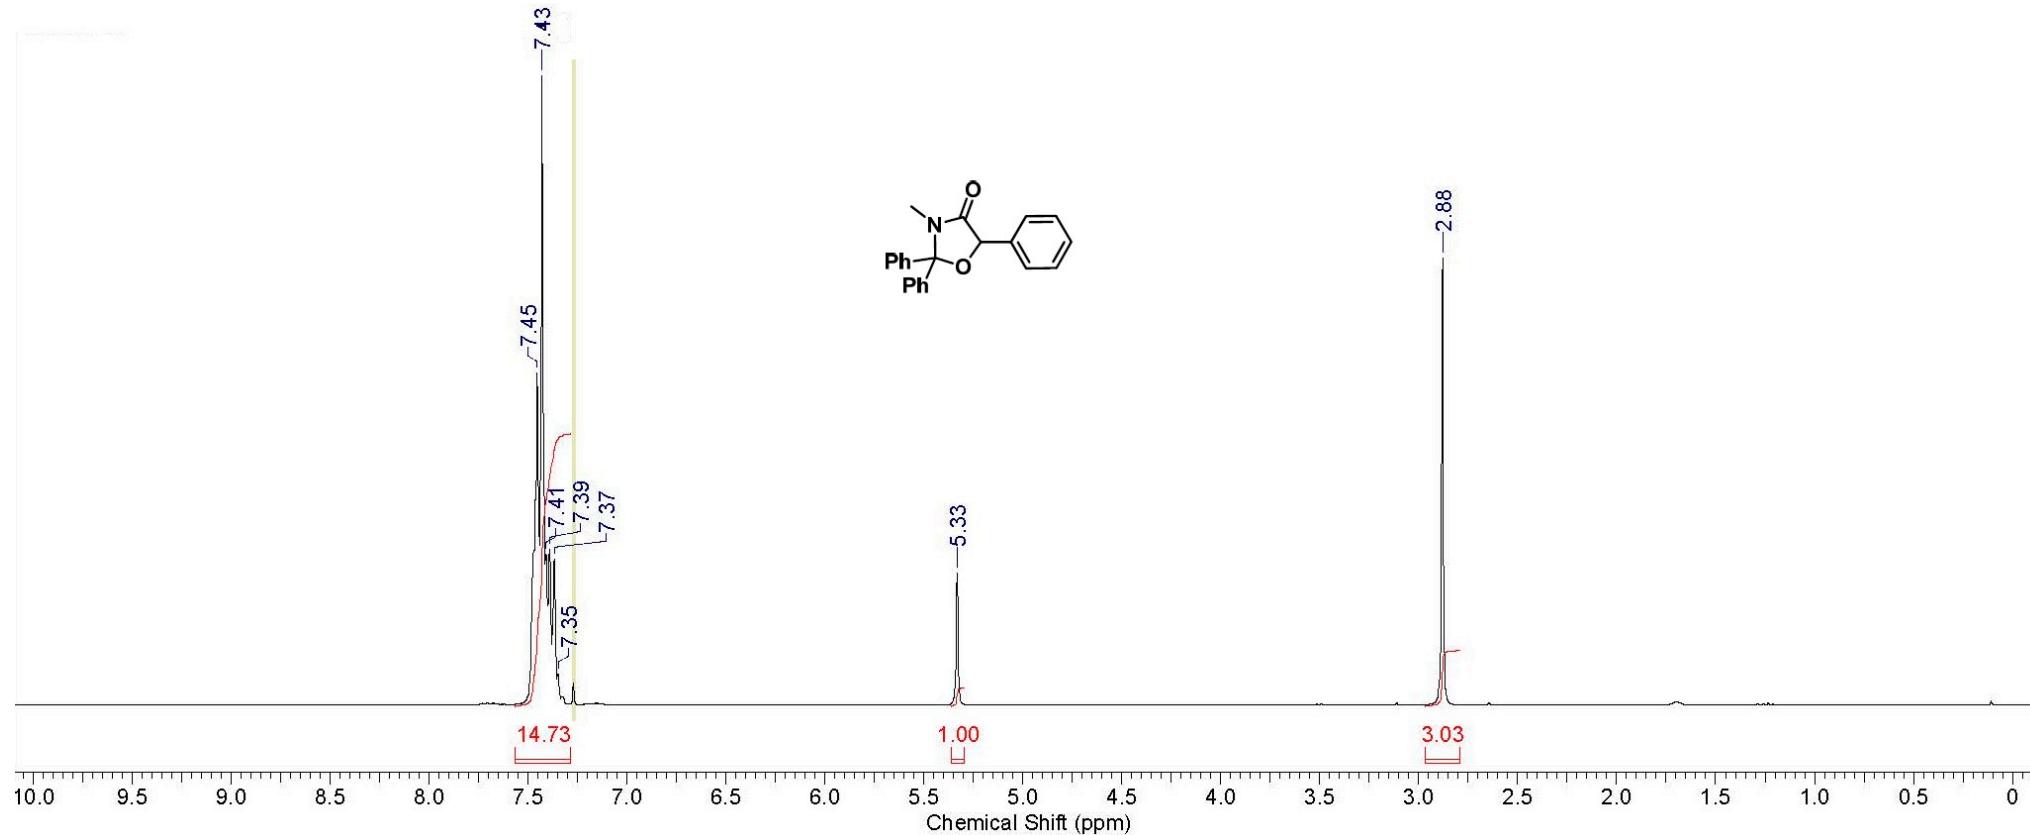

Table 1. Pairs of competing aldehydes **3a-e** and relative rate data for the reaction with azomethine ylide **12**.

Aldehyde N1/N2	n ^a	k ₁ /k ₂	s ^b	s _m ^c
3d/3c	6	9.49	1.24	0.51
3e/3d	11	3.39	0.41	0.12
3c/3a]	5	0.235	0.007	0.003
3b/3a	4	0.481	0.058	0.029

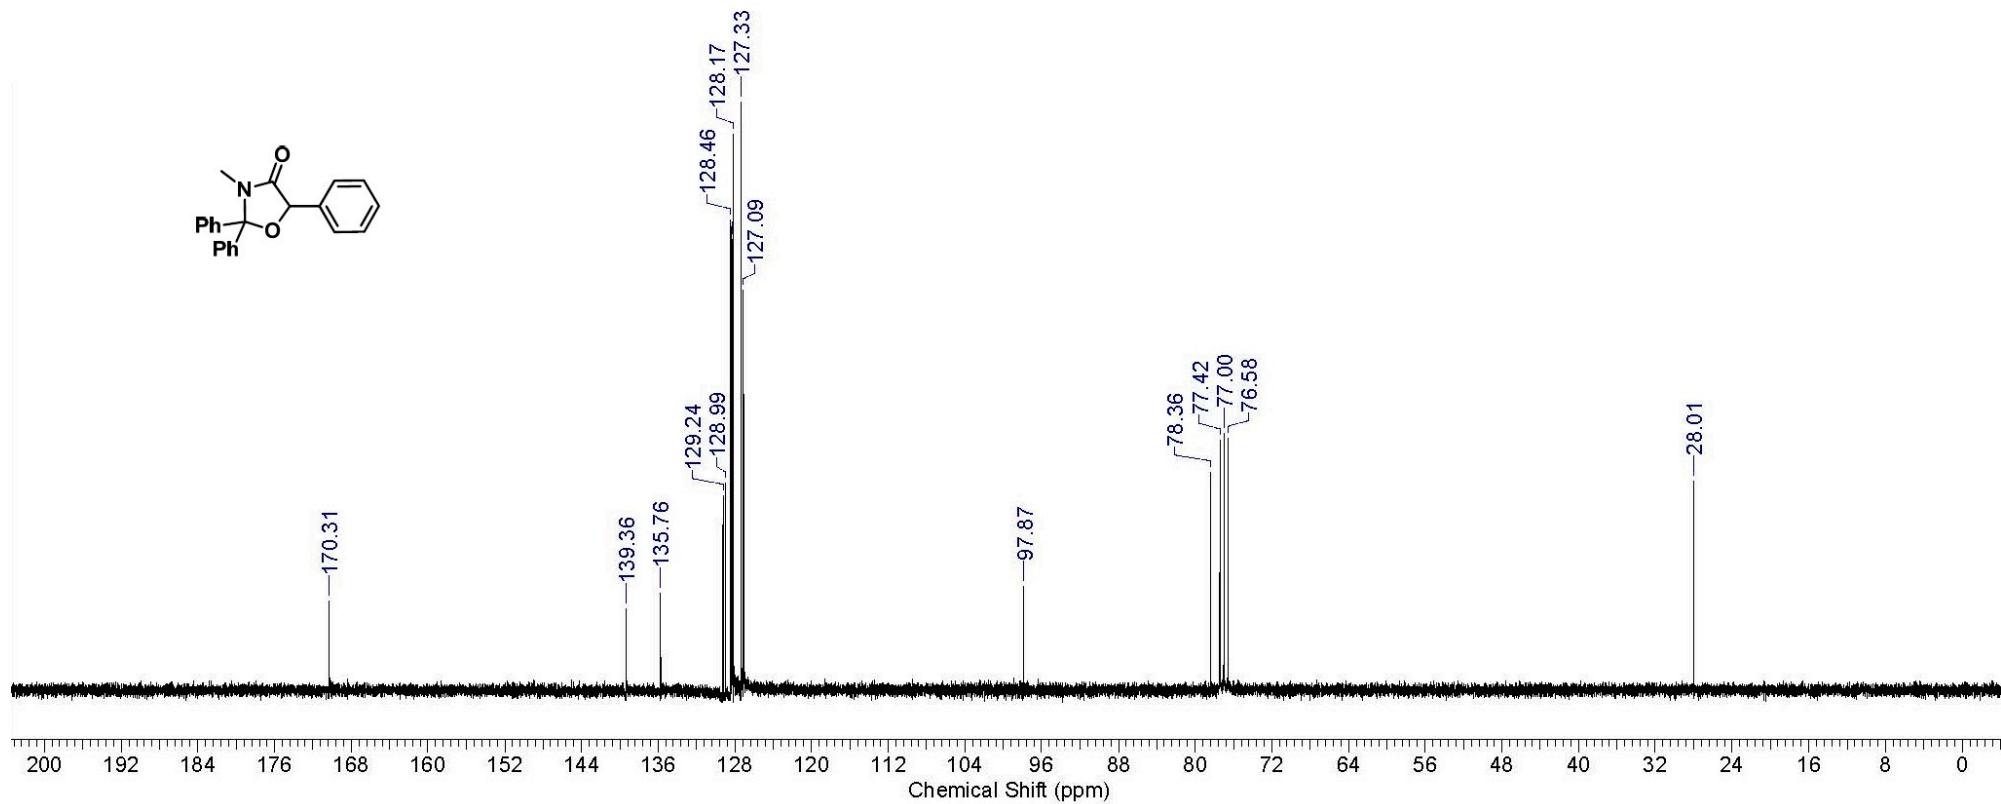

^a Number of experiments. ^b Standard deviation. ^c Standard mean square error.

Computational Details

All calculations were performed with the B3LYP density functional method¹ by using the Gaussian 09 suite of quantum chemical programs² at Resource center "Computer center of Saint Petersburg State University". Geometry optimizations of intermediates, transition states, reactants, and products in dichloromethane were performed at the DFT B3LYP/6-31G(d) level using PCM model.³ Stationary points on the respective potential-energy surfaces were characterized at the same level of theory by evaluating the corresponding Hessian indices. Careful verification of the unique imaginary frequencies for transition states was carried out to check whether the frequency indeed pertains to the desired reaction coordinate.
