Experimental section

Quantum Chemistry Calculation

Conformational analysis was initially performed using Discovery Studio (version 2016) at CHARMM force field for **1a** and **1b**. Energy cutoff was 20.0 kcal/mol and the maximum number of conformers was set 255 by default.

The theoretical calculation of conformers were carried out using Gaussian 09 program (Gaussian Inc., Wallingford, CT, USA).¹ The geometries of isomers were first optimized at HF/6-31G(d) in gas phase, and further optimized at B3LYP/6-31+G(d,p) using the polarizable continuum model (PCM) to take into account the solvent effect of DMSO. Vibrational frequency analysis was conducted to ensure that geometry optimizations had reached local minima. In order to reduce the high computational cost, room-temperature equilibrium populations for conformers after gas optimization were calculated according to Boltzmann distribution law (eq.1) and conformers with lower than 1% proportion were filtered.

$$\frac{N_i}{N} = \frac{g_i e^{-\frac{E_i}{k_B T}}}{\sum g_i e^{-\frac{E_i}{k_B T}}} \quad (1)$$

where N_i is the number of conformer i with energy E_i and degeneracy g_i at temperature T , and k_B is Boltzmann constant.

Finally, distances between hydrogen atoms were measured and weighted averages and standard deviations calculated according to Boltzmann-population.

Table S1. Energies of Dominant Conformers of 1a and 1b at B3LYP/6-31+G(d,p) in DMSO

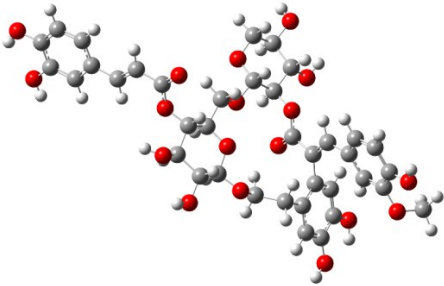

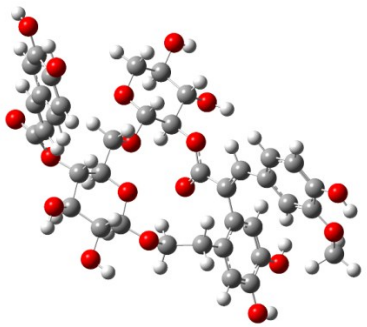

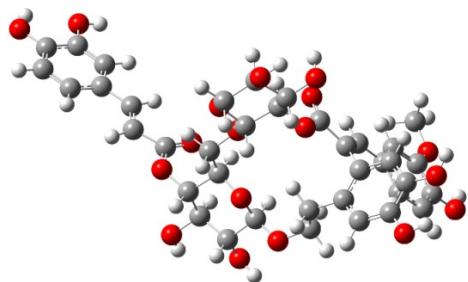

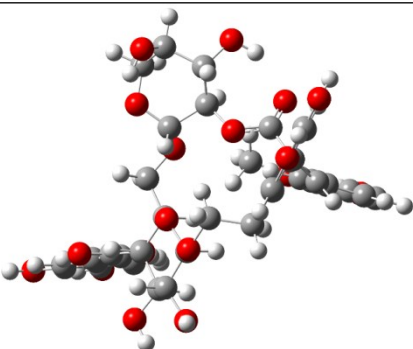

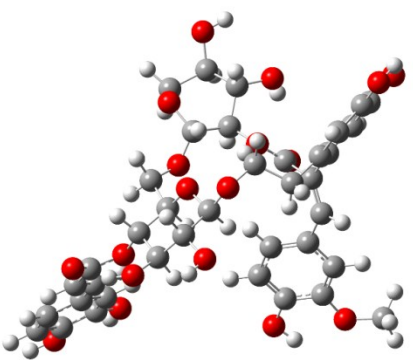

stereoisomer	no.	conformer	E (Hartree)	E (kcal/mol)	population (%)
1a	1		-2809.98412171	-1763291.64	98.35
	2		-2809.98000942	-1763289.06	1.26
	3		-2809.97870616	-1763288.25	0.32
1b	1		-2809.96638186	-1763280.51	15.01
	2		-2809.96801806	-1763281.54	84.99

Table S2. Weighted Average Distances and Standard Deviations Calculated upon Dominant Conformers for 1a and 1b

stereoisomer	conformer	distance (Å)			population (%)	predominant
		H-15/H-22	H-16/H-22	H-17/H-22		
1a	1	3.65	4.28	3.62	98.35	YES
	2	3.63	4.27	3.67	1.26	NO
	3	5.88	4.52	6.23	0.32	NO
	weighted average	3.66 ± 0.02	4.28 ± 0.00	3.63 ± 0.02		
1b	1	6.15	5.79	6.29	15.01	NO
	2	6.19	5.77	6.76	84.99	YES
	weighted average	6.18 ± 0.00	5.77 ± 0.03	6.69 ± 0.03		

Determination of the absolute configuration of sugars

Compound **1** (4 mg) was dissolved in 1M HCl (3 mL) to incubate at 65 °C for 14 h. After that, the reaction was concentrated to yield a residue. Then, the residue was suspended in water and then extracted with ethyl acetate (2 mL x 3). The water soluble layer was evaporated under vacuum and then dissolved in pyridine (2 mL). L-Cysteine methyl ester hydrochloride (2 mg) was added subsequently, and the reaction was maintained at 65 °C for 2 h. Then, *N*-trimethylsilylimidazole (0.6 mL) was added after the reaction was evaporated under vacuum. The reaction mixture was incubated at 65 °C for 2 h and partitioned between water and *n*-hexane (2 mL each for three times). Finally, the *n*-hexane layer was detected by GC experiment under the following conditions: capillary column, HP-5 (60 m × 0.25 mm, 0.25 μm, Dikma); detector, FID; detection temperature, 300 °C; injection temperature, 300 °C; initial temperature, 200 °C; raised to 260 °C at a rate of 10 °C/min, and maintained for 30 min, then declined to 200 °C at a rate of 40 °C/min and the temperature was maintained for 1 min; carrier, N₂ gas. D-glucose and D-xylose were determined by comparing their retention time with those of the authentic sugars, which displayed retention times of 29.5 and 19.0 min, respectively (Figure S1).

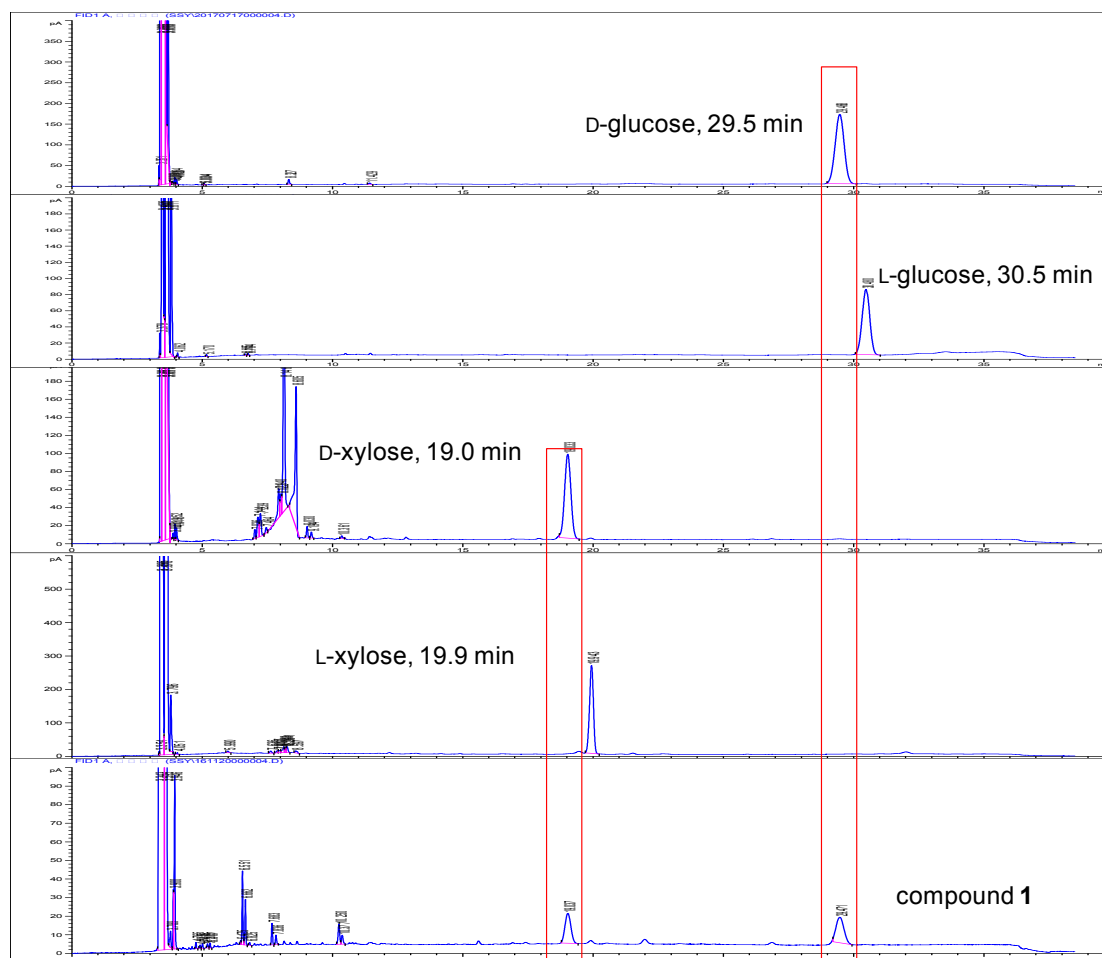

Figure S1. GC analysis of derivatives of D-glucose, L-glucose, D-xylose, L-xylose and hydrolysates of **1**.

Neuroprotective activities of extracts

The extracts of the fruits of *Forsythia suspensa* were tested for neuroprotective activities against rotenone-induced PC12 cell damage with an MTT assay (Table S3). The PC12 cells were cultured in Dulbecco's modified Eagle's medium supplemented (DMEM) with 5% horse serum and 5% fetal bovine serum. Then, 100 μ L cells with an initial density of 5×10^4 cells/mL were seeded in each well of a poly-L-lysine-coated, 96-well culture plate and precultured for 24 h at 37 $^{\circ}$ C under a 5% CO₂ atmosphere. The medium was then replaced by different fresh medium including the control (complete medium), the model (complete medium with 4 μ M rotenone), and the sample (complete medium with 4 μ M rotenone and 10 μ g/mL test samples), and the cells were cultured for 48 h. Then, 10 μ L of MTT (0.5 mg/mL) was added to each well and maintained for 4 h, and then the medium was removed. The formazan crystals were dissolved in 100 μ L DMSO and absorbance was measured on a microplate reader at 550 nm.² The cell viability (%) of each example was evaluated (Table S3).

Table S3. Neuroprotective Activities of Extracts against Rotenone-Induced PC12 Cell Damage (10 μ g/mL means \pm SD, $n = 6$)^a

	rotenone (%)
group	10 μ g/mL
control	100.0 \pm 6.3
model	54.2 \pm 2.8 ^{###}
total extract	58.0 \pm 4.4
petroleum ether fraction	54.0 \pm 5.1
EtOAc fraction	56.0 \pm 3.8
<i>n</i> -BuOH fraction	78.5 \pm 5.0 ^{***}
H ₂ O fraction	77.5 \pm 2.6 ^{***}

^{a###} $p < 0.001$ vs. control, ^{***} $p < 0.001$ vs. model.

Neuroprotective activities of 1 and 2

Rotenone-induced PC12 cell damage. Forsythenethosides A and B were tested for neuroprotective activities against rotenone-induced PC12 cell damage with an MTT assay (Table S4). The cells were cultured in Dulbecco's modified Eagle's medium supplemented (DMEM) with 5% horse serum and 5% fetal bovine serum. Then, 100 μ L cells with an initial density of 5×10^4 cells/mL were seeded in each well of a poly-L-lysine-coated, 96-well culture plate and cultured for 24 h at 37 °C under a 5% CO₂ atmosphere. The medium was then replaced by different fresh medium including the control (complete medium), the model (complete medium with 4 μ M rotenone), the positive contrast (complete medium with 4 μ M rotenone and 50 ng/mL nerve growth factor), and the sample (complete medium with 4 μ M rotenone and 10 μ M test compounds), and cultured for 48 h. Then, 10 μ L of MTT (0.5 mg/mL) was added to each well and maintained for 4 h before removing the medium. The formazan crystals were dissolved in 100 μ L DMSO and absorbance was measured on a microplate reader at 550 nm. The cell viability (%) of each example was evaluated (Table S4).

Serum-deprivation-induced PC12 cell damage. Forsythenethosides A and B were tested for neuroprotective activities against serum-deprivation-induced PC12 cell damage with an MTT assay (Table S4). The PC12 cells were cultured in Dulbecco's modified Eagle's medium (DMEM) supplemented with 5% horse serum and 5% fetal bovine serum. Then, 100 μ L cells with an initial density of 5×10^4 cells/mL were seeded in each well of a poly-L-lysine-coated, 96-well culture plate and cultured for 24 h at 37 °C under a 5% CO₂ atmosphere. The medium was then replaced by different fresh medium including the control (complete medium), the model (medium without serum), the positive contrast (medium without serum and 50 ng/mL nerve growth factor), and the sample (medium without serum and 10 μ M test samples). Then, the cells were cultured in DMEM without serum for 48 h. Then, 10 μ L of MTT (0.5 mg/mL) was added and maintained for 4 h before removing the medium. The formazan crystals were dissolved in 100 μ L DMSO and

absorbance was measured on a microplate reader at 550 nm. The cell viability (%) of each example was evaluated (Table S4).

Table S4. Neuroprotective Activities of 1 and 2 against Serum-Deprivation-Induced PC12 Cell Damage and Rotenone-Induced PC12 Cell Damage (10 μ M means \pm SD, $n = 12$)^a

	serum-deprivation (%)	rotenone (%)
group	10 μ M	10 μ M
control	100.0 \pm 4.1	100.0 \pm 3.0
model	31.3 \pm 5.3 ^{###}	59.9 \pm 3.0 ^{###}
NGF ^b	35.3 \pm 4.7 ^{***}	96.7 \pm 3.1 ^{***}
1	41.0 \pm 4.9 ^{***}	76.8 \pm 2.3 ^{***}
2	43.2 \pm 5.7 ^{***}	75.1 \pm 3.8 ^{***}

^{a###} $p < 0.001$ vs. control, ^{***} $p < 0.001$ vs. model. ^bNFG is the abbreviation of nerve growth factor.
