Despite the rigid construction of the tricyclic products, the inherent conformational flexibility of the cyclopentane ring led to great intermolecular variability in proton coupling constants, in accordance with Povarov literature (see Supplementary Figure 4). The nOe interactions observed in 8b, 8d and 8k matched 9e’s, and their structures were assigned by analogy to the crystal structure of 9e (Figure 2 and Supplementary Figure 2). Examples with a five-membered heterocycle as ring A, with or without a nitrogen bridgehead, displayed H²-H³ scalar couplings around 4 Hz. Interestingly, examples bearing a five-membered heterocycle ring A and a nitrogen bridgedhead, showed H²-H³ coupling constants ~4.5 Hz, whereas every other example showed spin couplings <2 Hz.

Crystallography Experimental Procedure

A crystal of 9e was recovered from an NMR tube containing a MeOD solution of 9e. The crystal was glued to a thin glass fiber and mounted on a Bruker D8 4-circle diffractometer equipped with a photon 100 detector. The detector distance was 50 mm and the data collection was carried out at 291K. Several different phiscans as well as omega scans were done to record all unique reflections. The intensity data were processed using CrysAlisPro (Rigaku) due to the problems with resolving the twinning with the APEX 3 software. Direct methods using SHELXS were used to solve the structure and refinement was performed using SHELXL.6 Hydrogen atoms were fixed on calculated positions using HFIX options in SHELXL. The 9e reflection data was measured to 0.83 Å resolution, but the number of significant reflections decreased below 1 Å resolution, a fact known from many sxtl investigations. The data set fulfilled “Sheldrick rule” that 50% of the reflections between 1.0 and 1.2 Å resolution should be significantly observed. The final structure is of high quality (Supplementary Table 1). The only aberration is the rather high internal R value, but this is partly related to the fact that the reflection data came from two individuals of the twinned crystal and partly to the rather high amount of nonsignificant reflections, 46% on average. This amount did of course increase below 1.0 Å resolution, thus contributing to the internal R-value. The structure was analysed and pictures were produced using Mercury, Coot and Pymol.7,9 The coordinates and structure factors have been deposited in the Cambridge Structural Database under CCDC number CCDC 1541016.

Computational Chemistry Experimental Section

Molecular Property Calculations

For each molecule, a single, neutralized, 3D minimized conformation was generated using Ligprep, as implemented in Schrödinger Suite (Schrödinger Release 2017-1: LigPrep, Schrödinger, LLC, New York, NY, 2017). The OPLS3 force field was used for minimizations. The Plane of Best Fit was then calculated for each 3D molecule using the Erlwood nodes as implemented in Knime 3.3.1 (https://www.knime.org/), while the other structural descriptors were calculated using DataWarrior 4.5.1 (http://www.openmolecules.org/datawarrior/index.html).
Synthetic Chemistry Experimental Section

General Information

All commercial reagents and solvents were used without further purification. All starting material ketones, amines and catalysts are commercially available. Cyclopentadiene was cracked and distilled prior to use. Analytical thin-layer chromatography was performed on silica gel 60 F-254 plates (E. Merck) and visualized under a UV lamp. Flash column chromatography was performed in a Biotage® SP4 MPLC system using Merck silica gel 60Å (40-63 mm mesh). $^1$H and $^{13}$C NMR spectra were recorded on a Bruker DRX-400 or a Bruker Avance III 600 MHz spectrometer. Chemical shifts are expressed in parts per million (ppm) and referenced to the residual solvent peak. Analytical LC-MS were performed on an Agilent MSD mass spectrometer connected to an Agilent 1100 system with: Method B1090A: Column ACE 3 C8 (50 x 3.0 mm); H$_2$O (+ 0.1% TFA) and MeCN were used as mobile phases at a flow rate of 1 mL/min, with a gradient time of 3.0 min; or Method 0597X3: Column Xterra MSC18 (50 x 3.0 mm); H$_2$O (containing 10 mM NH$_4$HCO$_3$; pH = 10) and MeCN were used as mobile phases at a flow rate of 1 mL/min, with a gradient time of 3.0 min. For LC-MS, detection was made by UV (254 or 214 nm) and MS (ESI+). All final compounds were assessed to be >95% pure by LC-MS analysis.

Typical procedure for the synthesis of products

Step 1
A solution of trifluoroacetic acid (0.6 mmol, 1 eq) in acetonitrile (1 mL) was added to a solution of heterocyclic amine (0.6 mmol, 1 eq) in acetonitrile (0.5 mL), followed by sequential addition of a solution of ketone (0.66 mmol, 1.1 eq) and yttrium (III) triflate (0.3 mmol, 0.5 eq) in acetonitrile (1 mL). The mixture was stirred at room temperature for one minute, followed by addition of a solution of cyclopentadiene (1.2 mmol, 2 eq) in acetonitrile (0.5 mL) (total reaction volume 3 mL), and subsequently stirred at the indicated temperature, until the amine starting material was consumed (determined by LC-MS). In some instances, additional ketone, yttrium (III) triflate and cyclopentadiene were added. The resulting mixture was concentrated in vacuo, passed through a silica pad and used in the next step without any further purification.

Step 2
The crude mixture from Step 1 was dissolved in acetone (2 mL) at 0 °C, treated with N-methylmorpholine N-oxide (1.2 mmol, 2 eq), followed by osmium tetroxide solution (2.5 wt. % in tert-butanol, 0.240 mmol, 0.4 eq) in water (2 mL). The reaction mixture was allowed to warm to room temperature, and stirred until the starting material was consumed (determined by LC-MS). In some instances, additional osmium tetroxide and N-methylmorpholine N-oxide were added. The reaction was quenched with QuadraPure® IMDAZ resin (3-fold excess in respect to the total amount of osmium used) and stirred at room temperature for 30 minutes. The resin was filtered off and the reaction mixture was concentrated in vacuo. The resulting residue was purified by flash column chromatography.

((Cyclopentadien-1-ylmethoxy)methyl)benzene (mixture of 10a, 10b and 10e)
Chloromethyl benzyl ether (330 µL, 376 mg, 2.40 mmol) was added to a stirred solution of cyclopentadienyl sodium salt (2M in THF, 1.32 ml, 233 mg, 2.64 mmol) in DMF (3 ml) at -40 °C and stirred for 1.5 h. The reaction mixture was quenched 0 °C with water (5 ml), extracted with hexane (2x5 ml), washed with water (5 ml), dried (MgSO4) and evaporated under a stream of N2 to give the crude alkylated CPD as a mixture of regioisomers 10a, 10b and 10e. LC-MS (ESI+): m/z: 187 [M+H]+. The crude residue was dissolved in MeCN (3 ml) and used immediately in Step 1, or stored at -20 °C for 24 or 48 h, and used in Step 1.

Step 1: Room temperature, 7 h.

Step 2: After 24 h, an additional portion of OsO4 and NMO was added. Total reaction time 48 h. The reaction mixture was purified by flash chromatography (0-10% MeOH / DCM) and the following three compounds were isolated (See Scheme 3 for yields):
