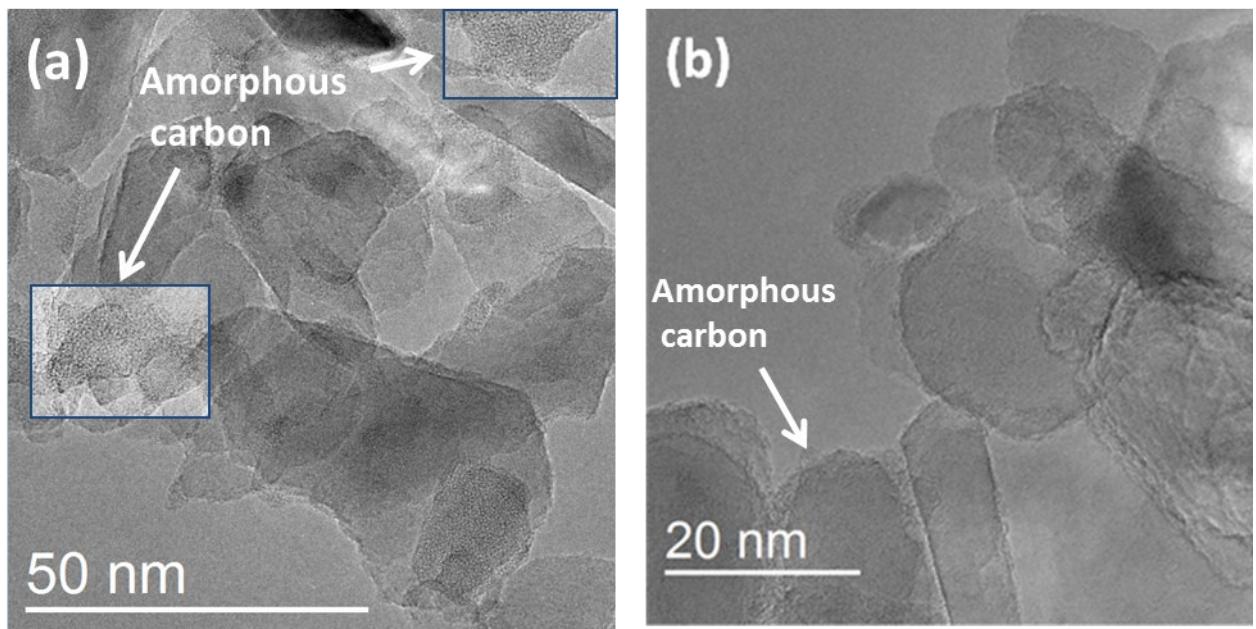

**Fig. S1** Removal of SiO<sub>2</sub> from the OND, ATR-IR spectra of: OND before HF/NH<sub>4</sub>F treatment (black) and after the treatment (red).

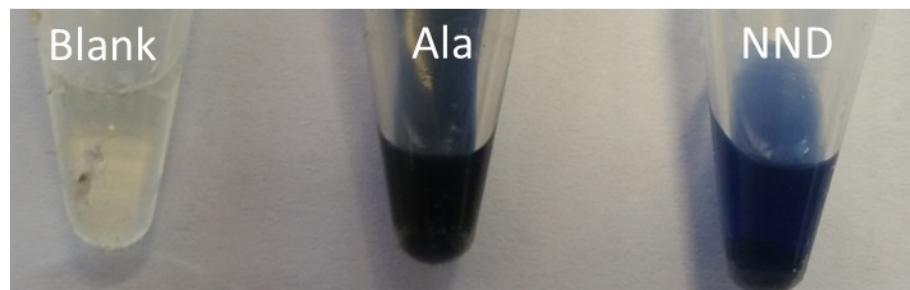

**Fig. S2** Removal of SiO<sub>2</sub> from the OND XPS spectra of: OND before HF/NH<sub>4</sub>F treatment (black), after treatment (red).

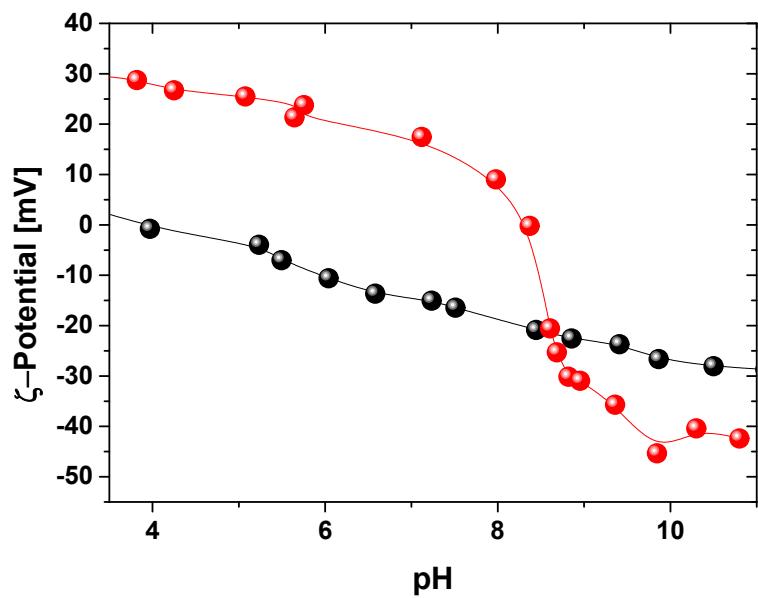

**Fig. S3** Raman spectra observation of degraphitisation and modification a) Duration time dependence for treatment of GND in air atmosphere at 590 °C; b) temperature dependence for treatment of GND in air atmosphere with a duration time of 24 hours; c) Nitrogen termination of OND in NH<sub>3</sub>- atmosphere at different temperatures with a duration time of 5 h.

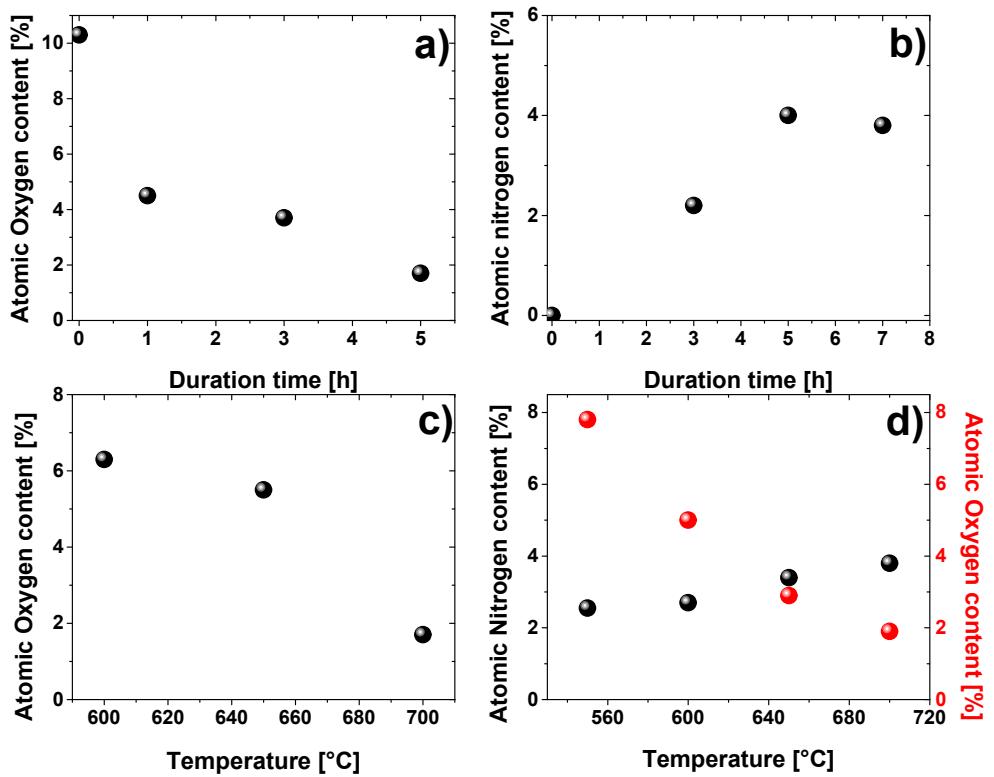

**Fig. S4** HRTEM image of NND samples a) prepared 700 °C ,7h; b) 600 °C 5 h).

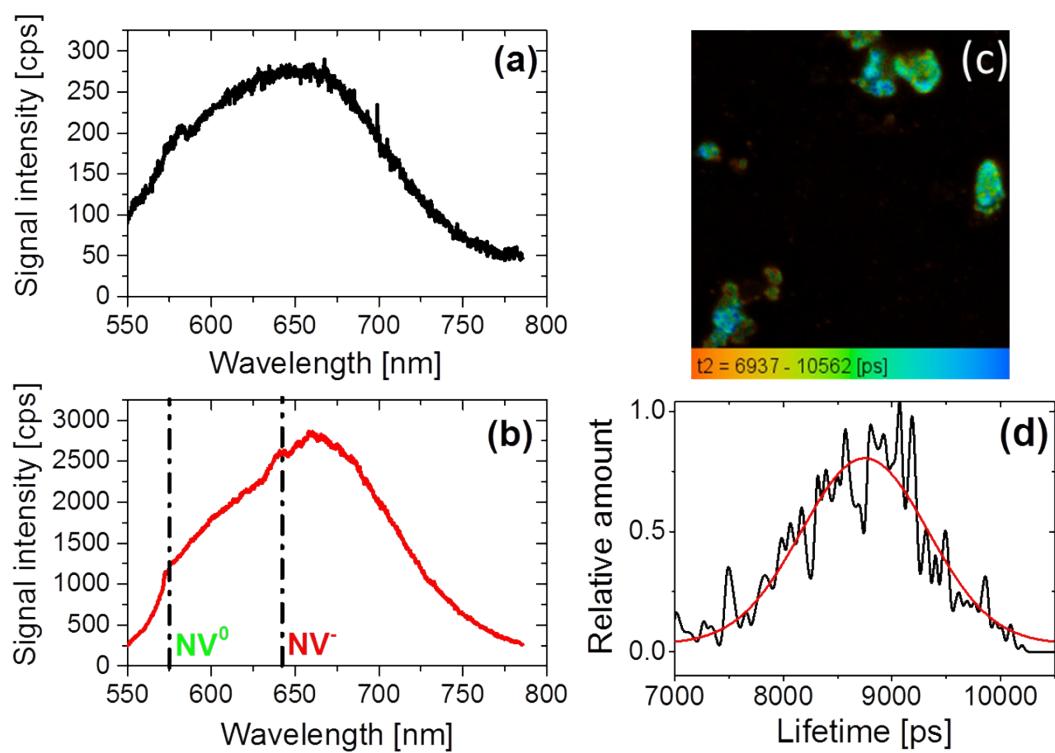

**Fig. S5** Representative results of a Kaisertest for NND prepared a 700 °C for 5 h: **left:** NND sample in water, **middle:** positive probe using alanine; **right:** positive result of NND.

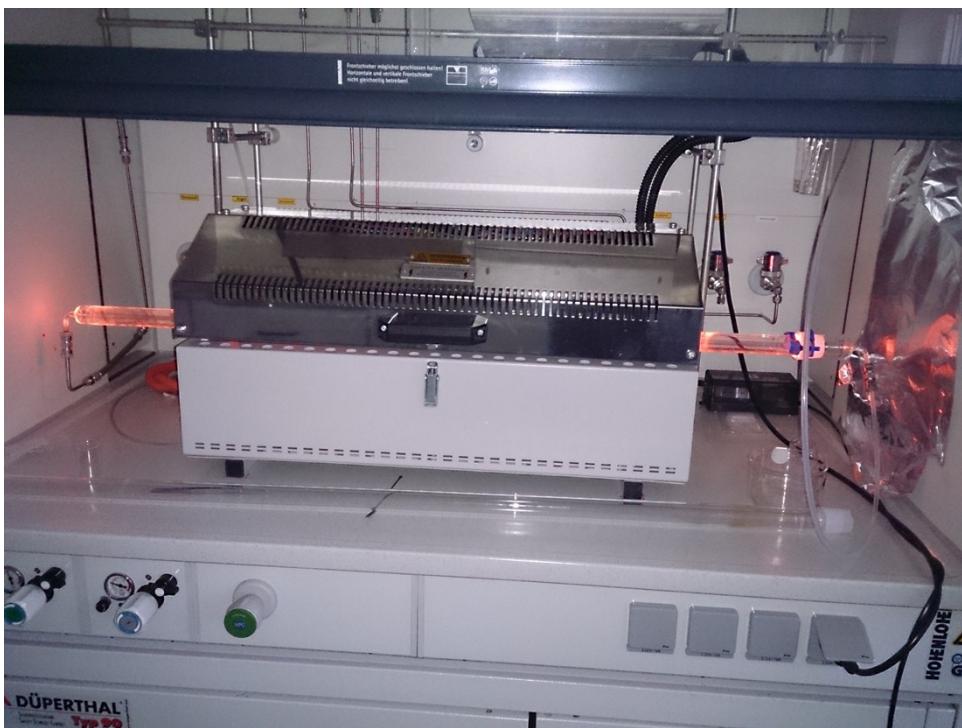

**Fig. S6** pH-value dependent measurements of the  $\zeta$ -potential of HND (black) and treated GND sample treated with hydrogen at 700 °C for 5 hours (red).

**Fig. S7** Process control of hydrogen and nitrogen termination starting from OND by XPS measurements a) atomic oxygen content of HND as a function of the duration in hydrogen atmosphere at 700 °C; b) atomic nitrogen content of NND as a function of the duration in ammonia atmosphere at 700 °C; c) Atomic oxygen content as a function of the reaction temperature in hydrogen atmosphere; d) atomic nitrogen and oxygen content of NND as a function of the reaction temperature in ammonia atmosphere.

**Fig. S8** Fluorescence properties of OND a) Fluorescence spectra of GND upon photoexcitation at 532 nm. The origin of the fluorescence is the non-diamond carbon; b) fluorescence spectra of OND upon excitation at 532 nm, the spectra shape is typical for NV<sup>0</sup>-, NV<sup>-</sup>-center with zero phonon lines at 575 nm and 639 nm; c) Fluorescence lifetime image ( $30 \mu\text{m} \times 30 \mu\text{m}$ ) of OND upon excitation at 513 nm; d) lifetime histogram determined from figure S7c.

**Fig. S9** Reactor for gas phase – solid phase reactor for hydrogen (C-H), oxygen and nitrogen termination (-NH<sub>2</sub>). Upper panel: open reactor; lower panel: reactor in operation with tight gas connections.
