1. General information

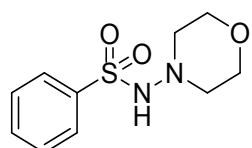

Except the special statement, all chemicals were purchased without further purification before use (Hydrazines were obtained by using NaOH (1 M) as base to neutralize the corresponding hydrazine hydrochlorides in water and extracted with ethyl acetate.). Solvents were dried by the standard method in solvent enchiridion or treated with molecular sieves. General operation were conducted in oven-dried schlenk under dry-air balloon. Melting points were recorded on a melting points apparatus and were uncorrected. Thin layer chromatography (TLC) was performed on silica gel GF-254 plates and visualized by fluorescence quenching under UV light. For column chromatography, 200-300 mesh of silica gel was used and performed by standard technique.

¹H-NMR and ¹³C-NMR spectra were recorded on a Bruker Avance 400 spectrometer in CDCl₃ [using (CH₃)₄Si (for ¹H, δ = 0.00; for ¹³C, δ = 77.00) as internal standard] at room temperature. All coupling constants were given in Hertz (Hz). Infrared (IR) spectra was performed on Bruker Vector 22 in KBr pellets. Highresolution mass spectra (HR MS) were obtained on a LTQ-Orbitrap XL with the ESI technique.

2. Typical procedure metal-free coupling reaction

Hydrazines **1** (0.25 mmol), K₂S₂O₅ (0.5 mmol), diamine (0.3 mmol), were added to a 25 mL schlenk tube under dry air balloon, followed by addition of CH₃CN (2.5 ml). The mixture was stirred at 40 °C for 12 h, then filtered and the solid was washed with ethyl acetate. The organic solution was dried over Na₂SO₄ and concentrated under vacuo. Then, crude product was purified by flash chromatography to afford the desired product **3**.
