## 1. General Information

Column chromatography was generally performed on silica gel (200-300 mesh) and reactions were monitored by thin layer chromatography (TLC) using UV light to visualize the course of the reactions. The <sup>1</sup>H (400MHz) and <sup>13</sup>C NMR (100MHz) data were recorded on Bruker AVANCE II 400MHz spectrometer using CDCl<sub>3</sub> as solvent. The chemical shifts ( $\delta$ ) are reported in ppm and coupling constants ( $J$ ) in Hz. <sup>1</sup>H NMR spectra was recorded with tetramethylsilane ( $\delta$ = 0.00 ppm) as internal reference; <sup>13</sup>C NMR spectra was recorded with CDCl<sub>3</sub> ( $\delta$  = 77.00 ppm) as internal reference.

### Reaction Apparatus:

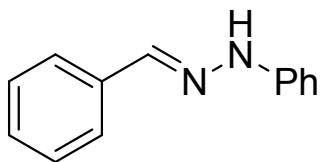

Photochemical reactions were carried out under visible light irradiation by a blue led bulb at room temperature.

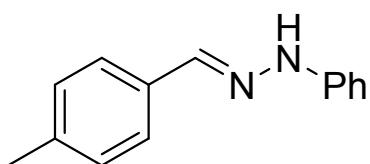

## 2. General procedures for synthesis of 3aa-3al and 3ba-3bl

To a solution of aryl hydrazines (0.5 mmol) and alkene (1.5 mmol) in MeCN (1.5 mL) was added Methylene Blue (0.01mmol) and 2, 6-lutidine (0.5 mmol). The reaction mixture was stirred at room temperature under air atmosphere (open vial) and irradiated by blue LED (7 W) for 8 h. The reaction was monitored by thin layer chromatography (TLC). When the reaction was completed, it was diluted with water and extracted with ethyl acetate 3 times. Removal of solvent followed by column chromatography afforded desired products.

#### 4. Synthesis of intermediate 6

To a solution of aryl hydrazines (0.5 mmol) and alkene (1.5 mmol) in MeCN (1.5 mL) was added Methylene Blue (0.01mmol) and 2, 6-Dimethylpyridine (0.5 mmol). The reaction mixture was stirred at room temperature under air atmosphere (open vial) and irradiated by blue LED (7 W) for 3 h. Then it was diluted with water and extracted with ethyl acetate 3 times. Removal of solvent followed by column chromatography afforded intermediate **6** (31 mg, 26%).

#### 5. Luminescence quenching by compound 1a

A Varian Cary Eclipse fluorescence spectrometer was used to record the emission intensities. All the solutions were excited at 664 nm and the emission intensity at 685

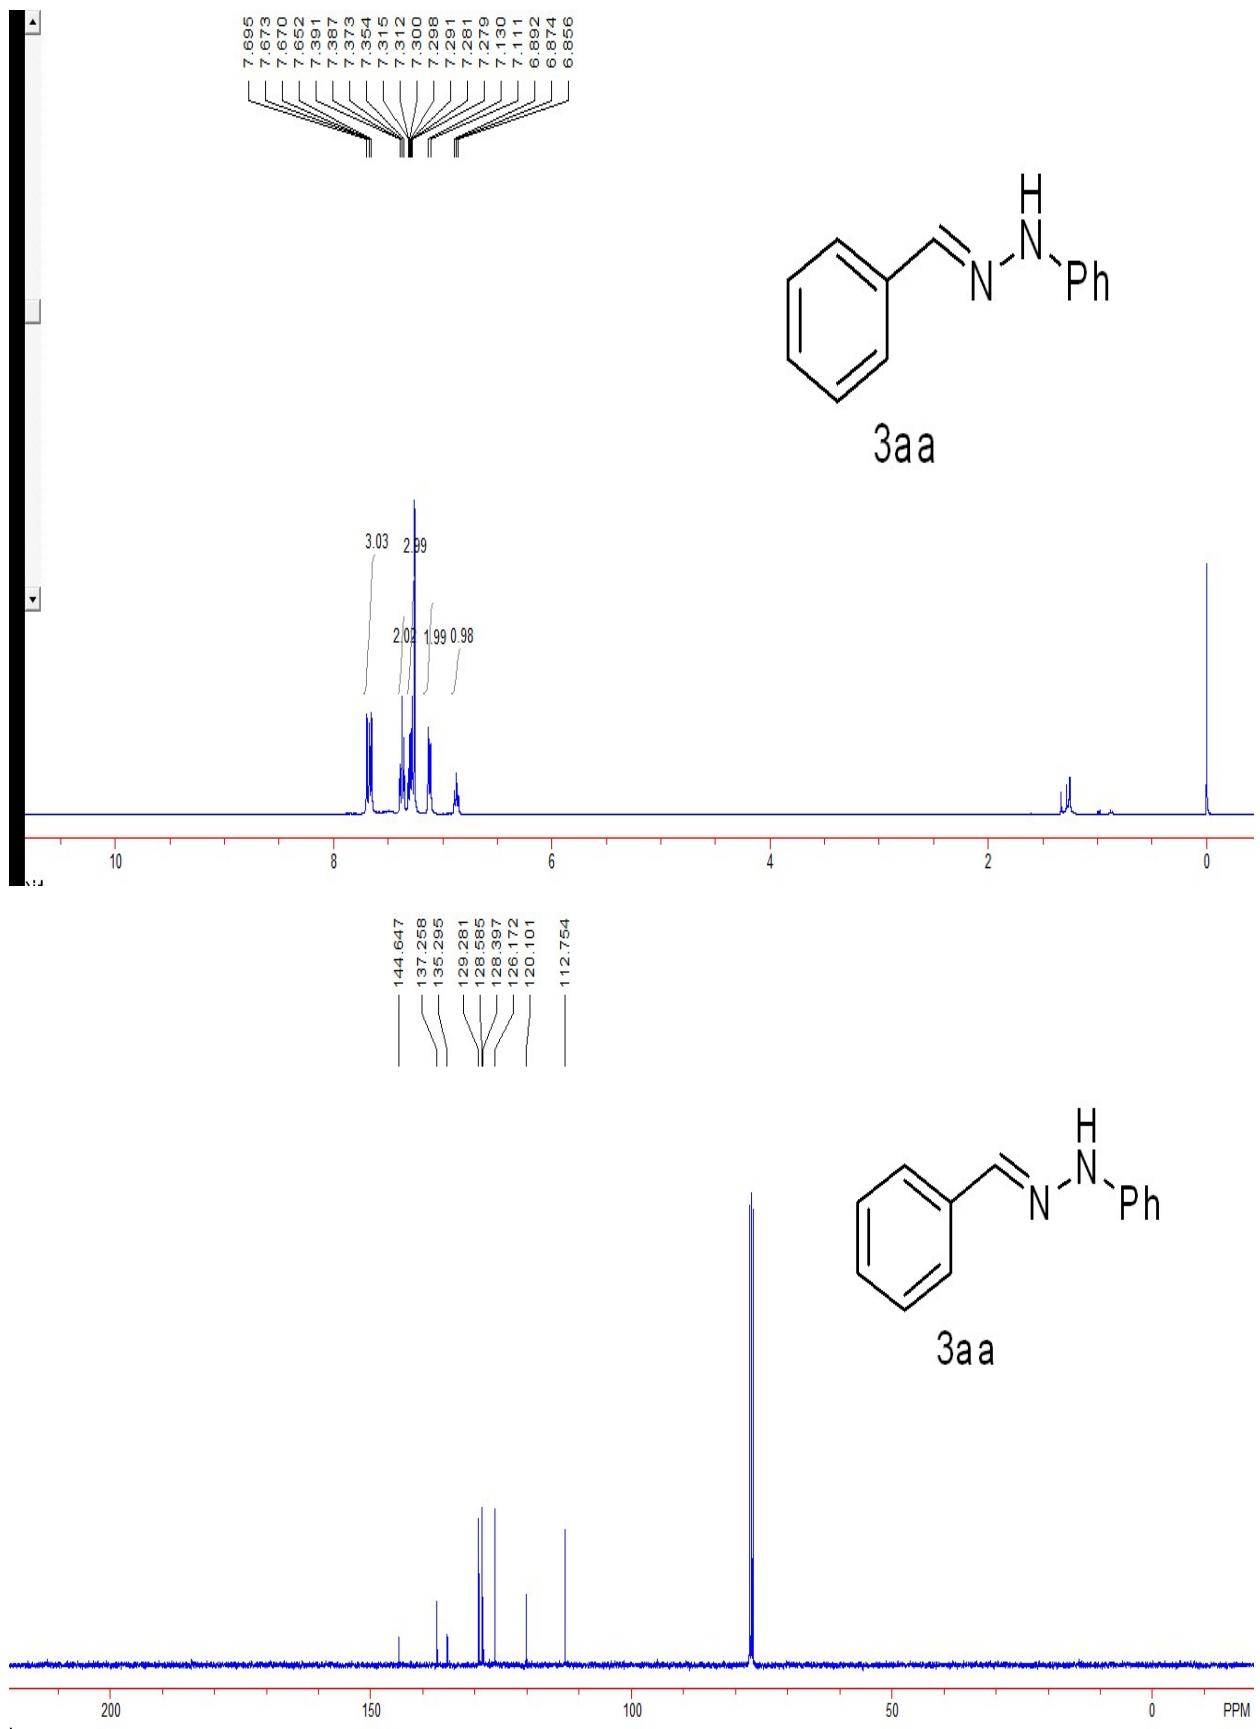

nm was observed. CH<sub>3</sub>CN was degassed with a stream of N<sub>2</sub> for 30 min. In a typical experiment, the emission spectrum of a 5×10<sup>-5</sup> M solution of Methylene Blue in CH<sub>3</sub>CN was collected. Then, appropriate amount of quencher was added to the measured solution in a quartz cuvette and the emission spectrum of the sample was collected. I<sub>0</sub> and I represent the intensities of the emission in the absence and presence of the quencher at 685 nm.
