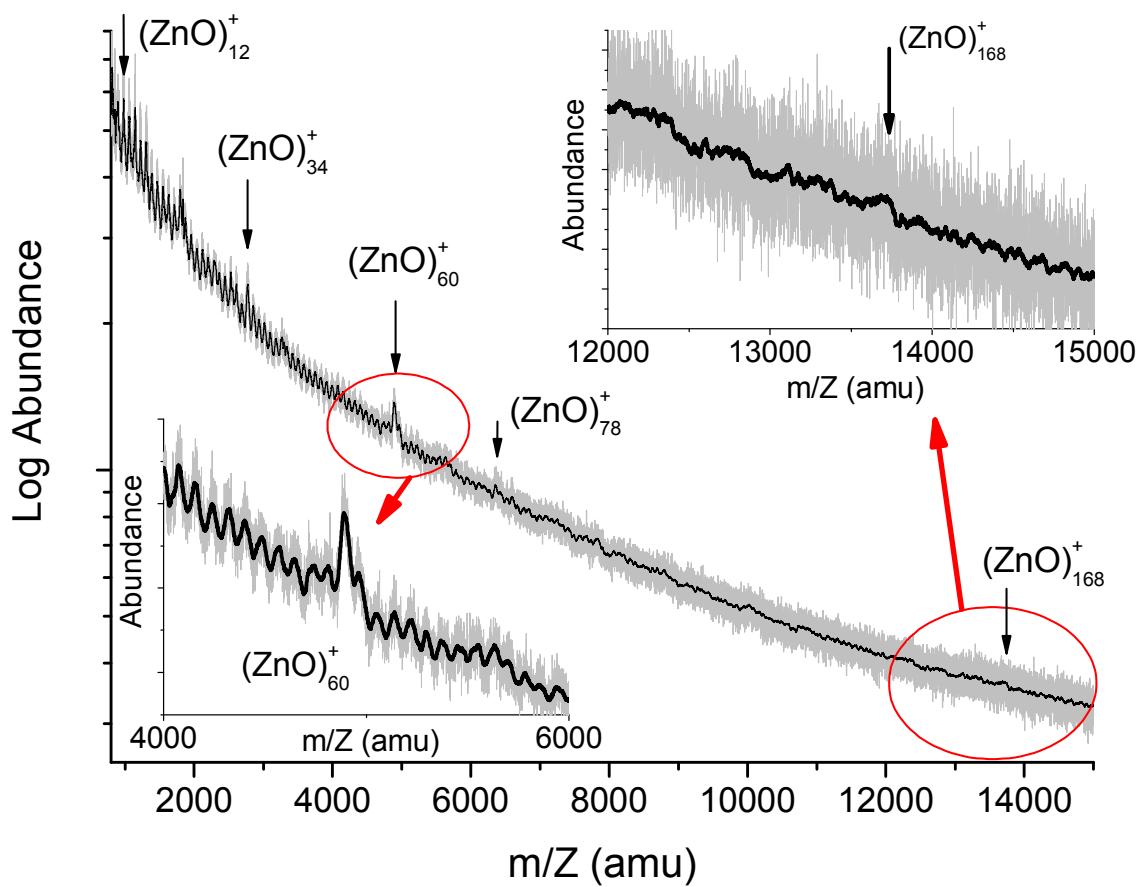

**Figure S1.** The Fourier transformed TOF mass spectrum of ZnO clusters shown in gray in Figure 1. The FFT power spectrum indicates what frequencies carry most of the energy. The main peak at 81.4 amu corresponds to the mass of  $(\text{ZnO})_1$  monomer. The peaks at 40.8 amu and 27.1 amu represent the numbers of double and triple charged ZnO clusters: obviously, they are negligible small. The peak at 1 amu indicates the resolution of the mass spectrometer high enough to resolve the isotopic structure of the clusters, although this structure is observable only for small clusters (see Figure S3).

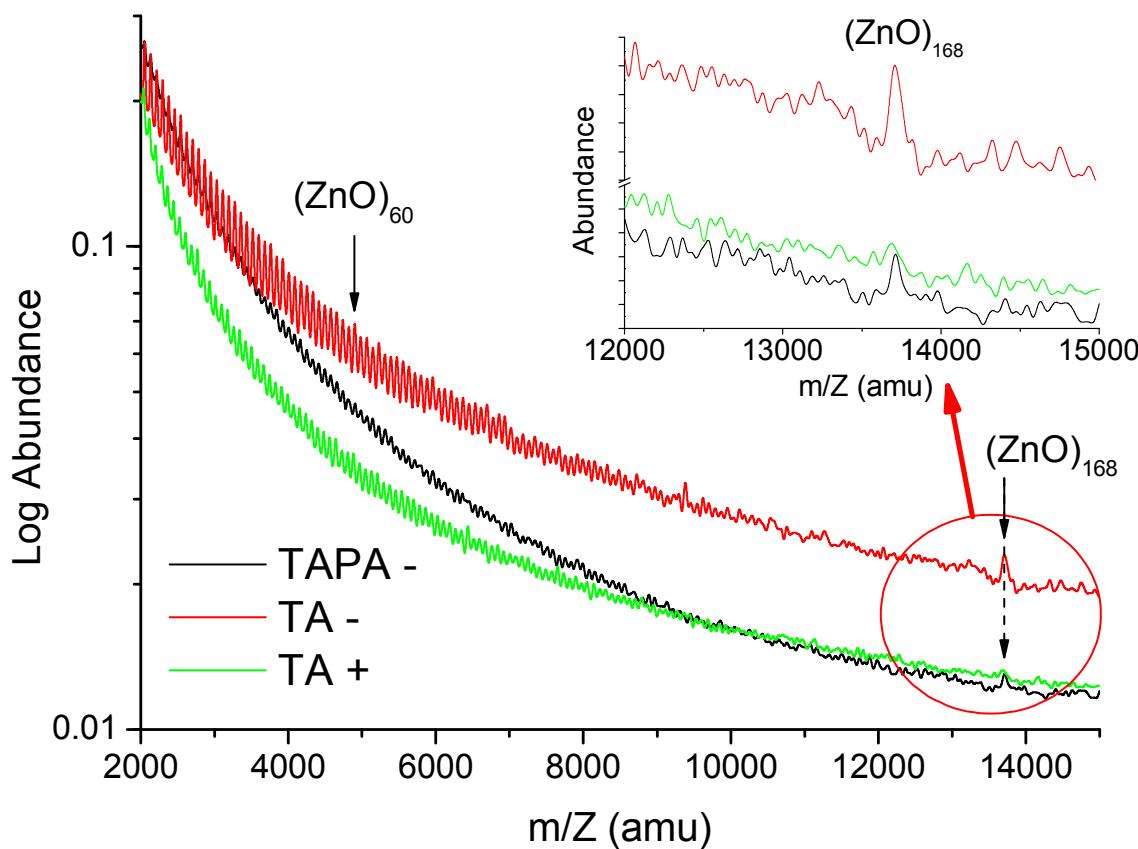

**Figure S2.** The linear fit (red line) of the series of experimentally detected ZnO clusters (black dots) in the region of masses where the series can be uninterruptedly traced. The dots are the peak positions in the smoothed mass spectrum of Figure 1. Extrapolation of the linear fit to the zero mass gives the y-intercept  $A = -0.26$  amu (instrumental error) and, as it is less than 1 amu, proves the stoichiometric composition of the observed  $(\text{ZnO})_n$  clusters. The slope  $B = 81.3$  amu corresponds to the mass of  $(\text{ZnO})_1$  monomer.

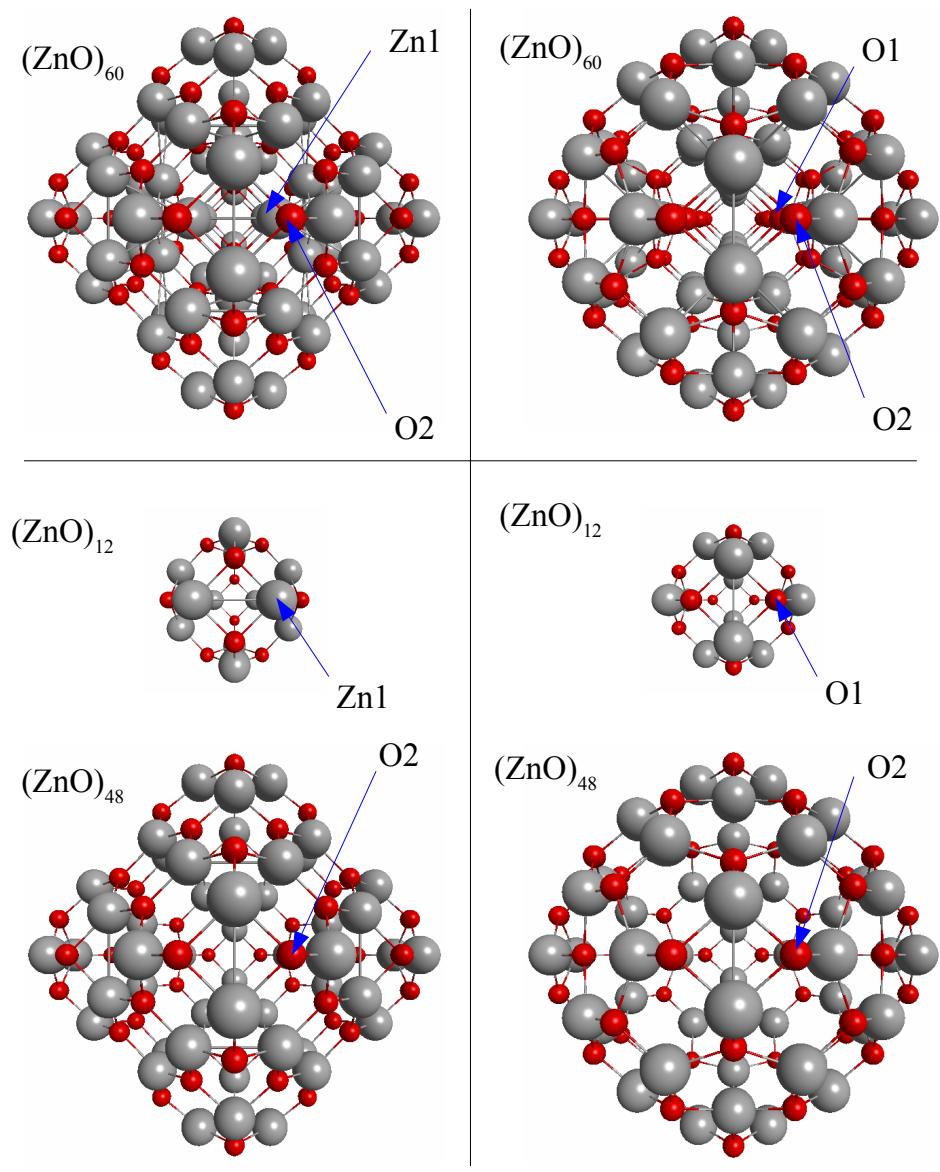

**Figure S3.** The fragments of the TOF mass spectrum of ZnO clusters (gray line of Figure 1) overlapped by the calculated patterns for the corresponding clusters (black lines) taking into account the natural isotopic distribution of constituting elements of the clusters. The patterns are calculated using ISOPRO software (<http://sites.google.com/site/isoproms/home>) based on Yergey's algorithm (J. A. Yergey. *Int. J. Mass Spectr. and Ion Physics* 1983, **52**, 337) using the following parameters: the empirical type, 30000 molecules, negatively charged by an electron, Gaussian peak shape, resolving power is 1600.

**Figure S4.** The TOF mass spectrum of positively charged ZnO clusters obtained by laser ablation of ZnO<sub>2</sub> powder mixed with octadecylamine in toluene. Gray line displays measured signal, black line shows the smoothed spectrum (50 point adjacent averaging). The clusters of enhanced stability are pointed and labeled. Insets show the fragments of the spectrum in the vicinity of  $(\text{ZnO})_{60}$  and  $(\text{ZnO})_{168}$  cluster mass regions.

**Figure S5.** The TOF mass spectra of ZnO clusters obtained by laser ablation of  $\text{ZnO}_2$  powder mixed with: trifluoroacetic acid (TA) and picolinic acid (PA) (negatively charged clusters, black line); TA (negatively charged, red line); TA (positively charged, green line). The spectra are 50 point FFT smoothed. Inset shows the fragments of the spectra in the vicinity of  $(\text{ZnO})_{168}$  cluster mass region. The positively charged  $(\text{ZnO})_{168}^+$  cluster is hardly detectable, same as in Figure S4, where it was produced with octadecylamine.

**Figure S6.** Comparison of  $(\text{ZnO})_{60}$  nested shell isomers. The top panel shows the onion-like structures of  $(\text{ZnO})_{60}$  cluster, left and right, both composed of two concentric shells  $(\text{ZnO})_{12}$  and  $(\text{ZnO})_{48}$  but with the different orientation of the inner shells. Zinc atoms are shown as gray balls, Oxygen as red. The shown structures are optimized at B3LYP/6-31G theory level within  $T_h$  symmetry restrictions. The pictures in the down panel shows the inner and the outer shells vertically spaced one from the other for clarity of the explanation.

The top-left structure, suggested in this paper, is designed to alternate the type of the neighboring atoms of the adjoining tetragonal faces of the inner and the outer shells, as for example Zn1 and O2 in the left pictures. Such structure allows tight hetero-bonding between the shells, thus decreasing the total energy of the cluster.

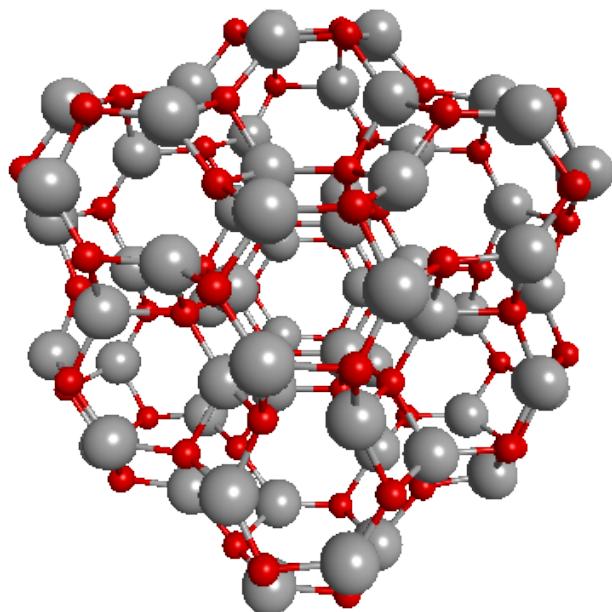

In contrast, the top-right structure, considered by Wang *et al.* (*J. Phys. Chem. C* 2010, **114**, 5741) and later by Caddeo *et al.* (*Phys. Chem. Chem. Phys.* 2012, **14**, 14293), places the same element atoms of the different shells in proximity, as for example O1 and O2, thus forcing energetically unfavorable homo-bonding. Consequently, the right-panel  $(\text{ZnO})_{60}$  cluster appears swollen compare to the left one, and has higher total energy.

**Table S1.** The calculated energy differences of the nested cage (this paper), onion-like and sodalite (both from Wang *et al.* *J. Phys. Chem. C* 2010, **114**, 5741) isomers of  $(\text{ZnO})_{60}$  cluster.

Our calculations at B3LYP/6-31G theory level show that the proposed in this paper  $T_h$  symmetric nested shell structure for  $(\text{ZnO})_{60}$  cluster has the total energy 6.076 eV lower than the total energy of the  $T_h$  symmetric onion-like structure proposed by Wang *et al.*, and it is 5.521 eV

lower in energy than the sodalite structure, which was found the most stable isomer of  $(\text{ZnO})_{60}$  cluster by both Wang *et al.* and Caddeo et al. (*Phys. Chem. Chem. Phys.* 2012, **14**, 14293). In other words, our calculations confirm the findings of Wang *et al.* and Caddeo *et al.* in part that the sodalite structure is more stable than the onion-like structure, which they have constructed, but our nested shell structure, which is built of the same shells but alternatively oriented, is much more stable than any of those reported. Our symmetry reduced structure, C<sub>1</sub>, has even lower energy.

**Figure S6\_2.** The B3LYP/6-31G optimized sodalite structure of  $(\text{ZnO})_{60}$ .

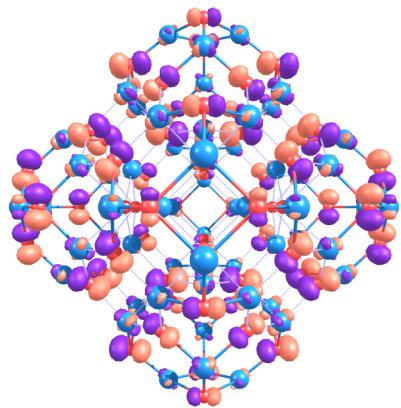

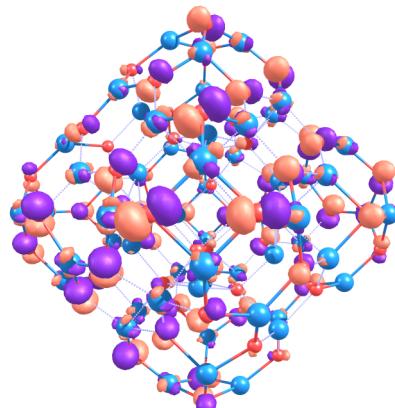

**Table S2.** The structures of  $(\text{ZnO})_{60}$  cluster and its moieties, the shells  $(\text{ZnO})_{12}$  and  $(\text{ZnO})_{48}$ , optimized at B3LYP/6-31G theory level within the restrictions of  $T_h$  symmetry point group (on the left) and  $C_1$  (on the right). Zinc atoms are shown as gray balls, Oxygen as red. The root mean square displacement (RMSD) calculation does not take into account shift and rotation of the clusters as a whole, but just the difference between their structures.

**Table S3.** The occupancies, energy levels and symmetries of molecular orbitals (MO) of  $(\text{ZnO})_{60}$  clusters of different symmetry point groups near the HOMO energy level, calculated within B3LYP/6-31G theory. Corresponding HOMO-LUMO gaps, the cluster total energies and their differences from the  $T_h$  symmetric structure, as well as the first 16 vibrational frequencies of Hessian analysis are listed in the bottom. The degenerate HOMO energies are marked yellow. The appearance of the imaginary first vibrational frequency in  $C_i$ ,  $C_3$  and  $S_6$  structures could be an artifact of the calculations.
