<sup>1</sup>All standards were analysed in the ESI-positive mode. Two most prominent transition ions generated from each precursor ion based on the optimized MS/MS parameters were chosen. The first MRM transition was used for quantification while the second MRM transition was used for identity confirmation. The desolvation temperature was 350 °C, and the source temperature was 150 °C. The capillary voltage was set at 1.5 kV and the cone voltage was set at 30 V. Nitrogen gas was used as desolvation gas and as cone gas. Nitrogen gas was produced using a NM30L nitrogen generator (Peak Scientific, Renfrewshire, Scotland).
