1. General information

The schematic processes of synthesis of the catalyst are depicted in Scheme 1. This catalyst was prepared from commercially inexpensive available materials and fully characterized using, the corresponding data, provided by FT-IR, SEM/EDX, XRD, TGA, BET, ICP-AES and VSM techniques.

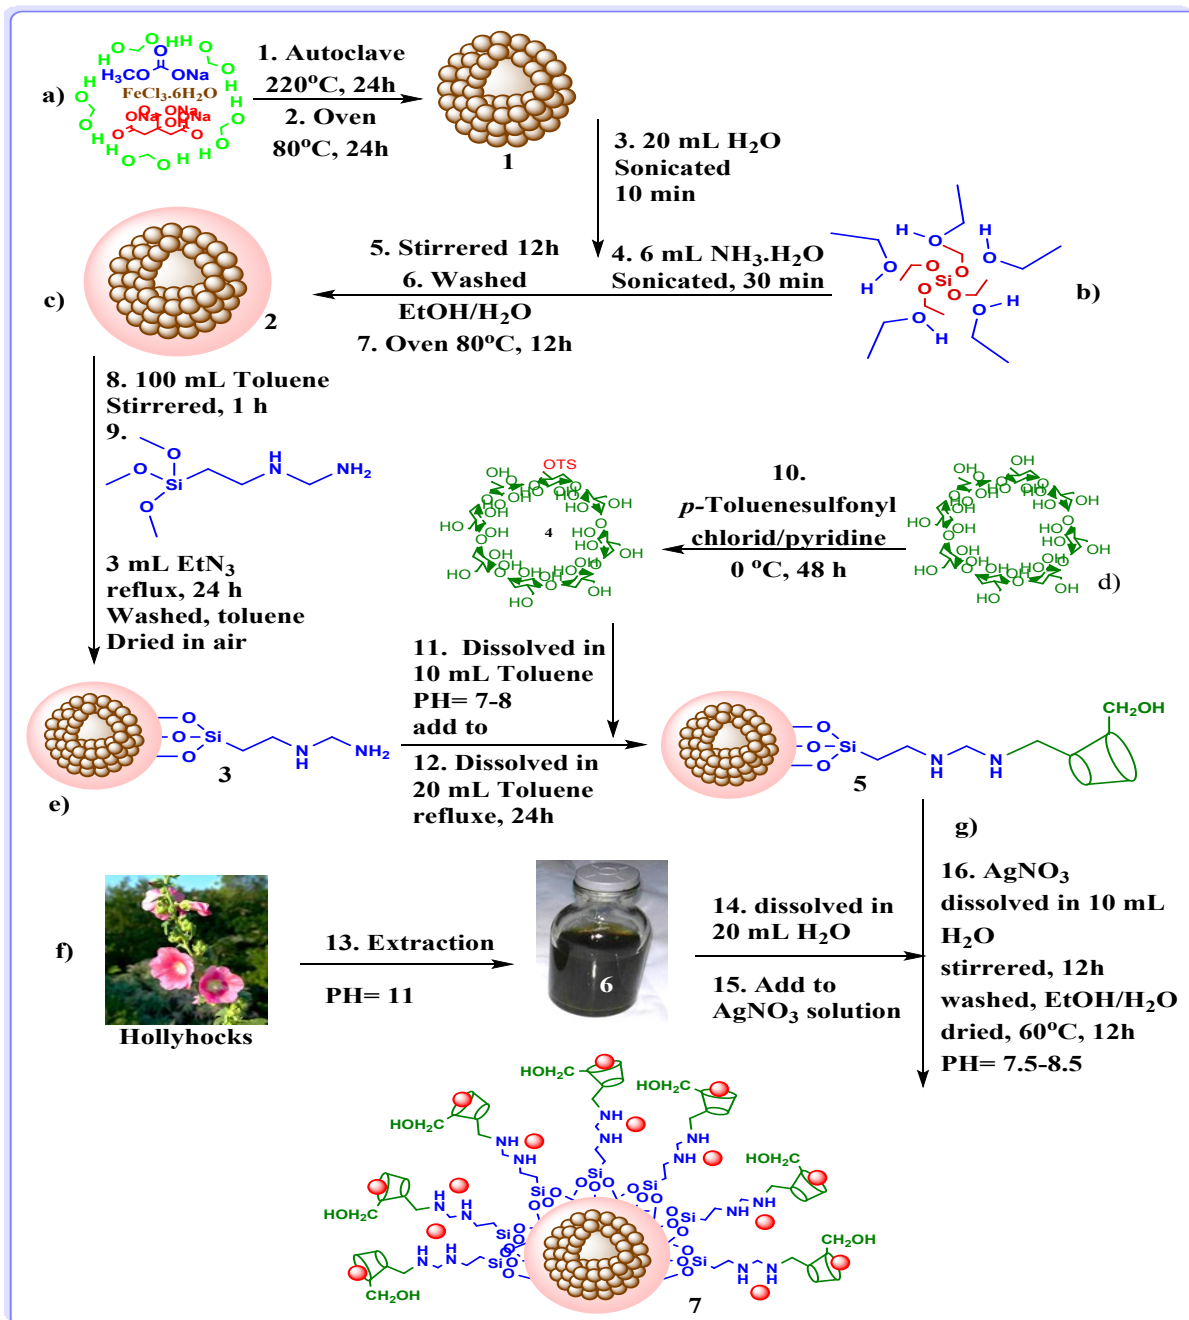

1.1. General details

All chemicals and reagents, including trisodium citrate dihydrate, sodium acetate trihydrate, $\text{FeCl}_3 \cdot 6\text{H}_2\text{O}$, TEOS, β -cyclodextrin, N-(2-(trimethoxysilyl)ethyl)methanedi-amine, toluene, triethylamine, acetone, ethanol, ethylene glycol (EG), urea, AgNO_3 and $\text{NH}_3 \cdot \text{H}_2\text{O}$, were analytical grade reagents, purchased from Sigma-Aldrich, and used without further purification. The progress of the organic reactions were monitored by TLC on commercial aluminum-backed plates of silica gel 60 F254, visualized, using ultraviolet light. Melting points were determined in open capillaries using an Electrothermal 9100 without further corrections. ^1H NMR and ^{13}C NMR spectra were recorded on Bruker DRX-400 spectrometer at 400 and 100 MHz respectively. The catalyst characterization was performed by using various characterization techniques including XRD, FTIR, BET, SEM/EDX, TGA, and ICP-AES. FTIR spectra were obtained by using PERKIN-ELMER- Spectrum 65 instrument. The BET analyses were carried out using BELSORP Mini II instrument. Prior to BET analyses, the samples were degassed at 423 K for 3h. SEM/EDX images were recorded by employing a Tescan instrument, using Au-coated samples and acceleration voltage of

20 kV. Room temperature powder X-ray diffraction patterns were obtained by using a Siemens, D5000.CuK α radiation from a sealed tube.
