## Table of Contents

**Figure 1S.** Speciation of citric acid as a function of the pH. The curve trends have been extracted from the reference cited in the manuscript. H<sub>3</sub>cit is the completed protonated citric acid and cit(-3) the deprotonated molecule.

**Figure 2S.** Evolution of the potential energy of the whole system during equilibration (around 200 ps) and the initial picoseconds of the production stage.

**Figure 3S.** Distribution of the Au-O(citrate) minimum distances (basic pH).

**Figure 1S.** Speciation of citric acid as a function of the pH. The curve trends have been extracted from the reference cited in the manuscript.  $H_3cit$  is the completely protonated citric acid and  $cit(-3)$  the deprotonated molecule.

**Figure 2S.** Evolution of the potential energy of the whole system during equilibration (around 200 ps) and the initial picoseconds of the production stage.

**Figure 3S.** Distribution of the Au-O(citrate) minimum distances (basic pH).
