### A. General information

All manipulations were carried out under air atmosphere unless otherwise specified. The reactions were monitored by GC (7820A, Hubei University of Science and Technology) and GC-MS (QP2010, Hunan University). The <sup>1</sup>H NMR and <sup>13</sup>C NMR spectra were recorded on a Brucker ADVANCE III spectrometer at 400 MHz and 100 MHz, respectively (Hubei University of Science and Technology). Flash column chromatography was performed using silica gel 40-70 μm (200-300 mu). Amides were purchased from Energy Chemical, Alfa Aesar, Aladdin or Maya Reagent, alcohols or esters were purchased from Energy Chemical.

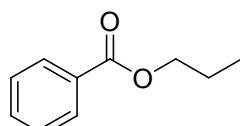

### B. General information

A 25 mL Schlenk-type tube equipped with a magnetic stir bar was charged with FeCl<sub>3</sub>.6H<sub>2</sub>O (0.04 mmol, 20 mol%), then amide **2** (0.24 mmol), alcohol or ester (0.24 mmol), HCl (0.24 mmol, 36%-38%), *n*-hexane (1.0 mL), was added at room temperature, and then the reaction mixture was stirred at 80 °C for 14 h. The reaction was monitored by GC. After completion of the reaction, the resulting solution was neutralized with saturated NaCl solution. The product was extracted with EtOAc or CHCl<sub>3</sub>, dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and concentrated in vacuo. The crude product was purified by flash column chromatography on silica gel to give analytically pure product.
