**On variation of the belt and chiral screw and spring
conformations of substituted regioregular HT
undecathiophenes**

by Jan Cz. Dobrowolski* and Małgorzata E. Jamróz

Object	Caption	Page
Table 1ESI.	The B3LYP and LC- ω B97XD total energies and Gibbs free energy differences (ΔE or ΔG_{298} , kcal/mol) for the S-shaped, C-shaped and P-planar dodecathiophenes calculated using 6-31G**, cc-pVTZ and cc-pVQZ basis sets (composed of 989, 2030, and 3789 basis functions, respectively). For B3LYP/6-31G** and B3LYP/cc-pVTZ calculations the role of Grimme's D3 correction for dispersion interactions was also checked. ΔE_C and $\Delta G_{298,C}$ denote that the appropriate energies of the C conformer were subtracted. nc stands for not converged	3
Table 2ESI.	Gibbs free energy and total energy (hartree) of the belt, screw and spring conformers of undecathiophenes and 3-substituted thiophenes calculated at the B3LYP/6-31G** level	4
Table 3ESI.	Gibbs free energy and total energy and energy of hyperhomodesmotic reaction (kcal/mol) for the belt, screw and spring conformers of undecathiophenes calculated at the B3LYP/6-31G** level. Gibbs free energy and total energy (hartree) of the 3-substituted thiophenes calculated at the B3LYP/6-31G** level.	5
Table 4ESI.	Four parameters applied to characterize the substituted belt, screw and spring conformers of undecathiophenes calculated at the B3LYP/6-31G** level. HOMA is the index calculated based on 43 CC bonds, 1st-last is the distance (in angstroms) between the first and 43rd C-atom, tau is the mean of the absolute values of all SCCS torsion angles, and $\Sigma(c=c)$ is the sum of all CC distances linking the thiophene rings (in angstroms).	6
Table 4A-ESI.	The subsequent CC distances (Å) in the studied belt structures calculated at the B3LYP/6-31G** level	7
Table 4B-ESI.	The subsequent CC distances (Å) in the studied screw structures calculated at the B3LYP/6-31G** level	10
Table 4C-ESI.	The subsequent CC distances (Å) in the studied spring structures calculated at the B3LYP/6-31G** level	13
Table 5ESI.	Population of the σ - and π - valence orbitals in 3-substituted thiophenes and substituent effect descriptors based on the thiophene ring C-atoms based on NBO populations calculated from B3LYP/6-31G** optimized structures.	16
Table 6ESI.	Volume of 3-substituted thiophenes and pure substituents estimated based on cavity volume or surface calculated assuming the scrf= (ieffpcm,solvent=water, read) key and PCMDoc PDens=1.0 as the "read" parameters using the single point at the 6-31G** calculations of the structures optimized in vacuum. Index "rel" means that unsubstituted and thiophene with abstracted hydrogen in position 3 was subtracted. L_{subst} denotes length of the substituent from the ipso C-atom to the most distanced atom of the substituent or the position of the face defined by atoms as in CF_3 or CBr_3 groups. W is the substituent width calculated from the cavity, and surface, assuming that the substituent volume is equal to the volume of a cylinder, or a cuboid or with one dimension equal to two radii of the bulkiest atom of the substituent.	17
Table 7ESI.	Parameters of helix fitted using HELFIT program1 based on coordinates of eleven S-atoms of each screw and spring conformers of the substituted undecathiophenes. The helix equation is expressed as follows: $x=a \cdot \cos(t)$; $y=a \cdot \sin(t)$; $z=b \cdot t$, where a is the helix radius and pitch is defined as $2 \cdot \pi \cdot b$, a and pitch are in angstroms. Number of thiophene rings per turn is denoted as NTRT. Bond length alternation (BLA), defined as the difference between the average long and short C-C distances in the conjugated π system.	18
Fig. 1ESI.	Correlations between substituent effect descriptors sEDAT (a, b), pEDAT (c,d) and (s+p)EDAT and HOMA index (a, c, e) and averaged module of the torsion SCCS angle (b, d, f) of the belt (black), screw (red) and spring (green) conformations of eleven substituted undecathiophenes	19
Fig. 2ESI.	Correlations between the averaged module of the torsion SCCS angle and helix radius (a) and helix pitch (b) and between the helix radius and number of thiophene rings per turn NTRT (c) for screw and spring undecathiophenes. Linear correlations between HOMA index and the bond length alternation BLA (d). The spread of points have the same reasons as the spread of points in figures presented in the main text.	20

Table 6ESI. Volume of 3-substituted thiophenes and pure substituents estimated based on cavity volume or surface calculated assuming the scrf=(iefpcm,solvent=water,read) key and PCMDoc PDens=1.0 as the "read" parameters using the single point at the 6-31G** calculations of the structures optimized in vacuum. Index "rel" means that unsubstituted and thiophene with abstracted hydrogen in position 3 was subtracted. L_{subst} denotes length of the substituent from the ipso C-atom to the most distanced atom of the substituent or the position of the face defined by atoms as in CF₃ or CBr₃ groups. W is the substituent width calculated from the cavity, and surface, assuming that the substituent volume is equal to the volume of a cylinder, or a cuboid or with one dimension equal to two radii of the bulkiest atom of the substituent.

Substituent	3-subst thiophene		sole substituent

Table 7ESI. Parameters of helix fitted using HELFIT program¹ based on coordinates of eleven S-atoms of each screw and spring conformers of the substituted undecathiophenes. The helix equation is expressed as follows: $x=a\cdot\cos(t)$; $y=a\cdot\sin(t)$; $z=b\cdot t$, where a is the helix radius and pitch is defined as $2\cdot\pi\cdot b$, a and pitch are in angstroms. Number of thiophene rings per turn is denoted as NTRT. Bond length alternation (BLA), defined as the difference between the average long and short C-C distances in the conjugated π system.
