## Materials and instrumentation

All starting materials were purchased from commercial sources and used as received unless stated otherwise. The solvents used for synthesis were of analytical grade. The compounds 3,5-di-tert-butylphenylacetylene, ${ }^{1}\left[{ }^{t} \mathrm{BuC} \equiv \mathrm{CAu}\right]_{12}{ }^{2}$ and $\left[{ }^{t} \mathrm{BuC} \equiv \mathrm{CAg}\right]_{n}{ }^{2}$ were prepared according to the literature procedures.
${ }^{1} \mathrm{H}$ NMR and ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY NMR spectra were recorded on a Bruker Avance 400 or 500 DRX FT-NMR spectrometer. Elemental analyses were performed on a Flash EA 1112 elemental analyzer at the Institute of Chemistry, Chinese Academy of Sciences, Beijing. Electrospray-ionization (ESI) mass spectra were recorded on a Waters Q-TOF Premier mass spectrometer. Emission lifetime measurements were performed on a Quanta Ray DCR-3 pulsed Nd:YAG laser system (pulse output $355 \mathrm{~nm}, 8 \mathrm{~ns}$ ). The photocurrent signal was recorded by a Tektronix Inc. Model 2430 digital oscilloscope and processed using Origin 8.5 for exponential fit. Emission spectra were performed on a Spex Fluorolog Model 1168 fluorescence spectrometer.

## Syntheses of 1-7

DtbpC=CAu: Diisopropylamine ( 1 mL ) was added to a solution of 3,5-di-tert-butylphenylacetylene ( $214 \mathrm{mg}, 1 \mathrm{mmol}$ ) and $\mathrm{Au}\left(\mathrm{SMe}_{2}\right) \mathrm{Cl}(295 \mathrm{mg}, 1 \mathrm{mmol})$ in dichloromethane ( 10 mL ) with stirring. White precipitate was observed at the start and disappeared with addition of more diisopropylamine. Five minutes later, the clear solution was concentrated and the white precipitate was collected and washed with methanol to yield DtbpC $=\mathbf{C A u}$ as a white solid ( 399 mg , yield: $78 \%$ ). Elemental analysis: calculated (\%) for $\mathrm{C}_{16} \mathrm{H}_{21} \mathrm{Au} \cdot \mathrm{C}_{6} \mathrm{H}_{15} \mathrm{~N}$ : C 51.66, H 7.09, N 2.74 ; found: C 51.26, H 7.14, N 2.76.

DtbpC=CAg: Triethylamine ( 0.5 mL ) was added to a solution of 3,5-di-tert-butylphenylacetylene ( $214 \mathrm{mg}, 1 \mathrm{mmol}$ ) and AgOTf ( $258 \mathrm{mg}, 1 \mathrm{mmol}$ ) in methanol ( 5 mL ), giving a white precipitate immediately. After stirring for 5 min , the precipitate was collected by filtration and dried in vacuum to yield DtbpC=CAg as a white solid ( 216 mg , yield: 67\%). ## Crystal structure determination

Intensity data of capillary-sealed crystal of 1 were collected at 220 K on a Bruker D8 Venture diffractometer with $1 \mu S$ Mo microfocus source. Crystals of 2-7 were quickly mounted in a glass fiber and measured at a temperature of $100 \mathrm{~K}(\mathbf{2}, \mathbf{3}$ and $\mathbf{7}$ ) or $200 \mathrm{~K}(4-6)$; X-ray diffraction data
were collected on a Bruker Proteum X8 diffractometer with monochromated $\mathrm{Cu}-\mathrm{K} \alpha$ radiation or Bruker D8 Venture diffractometer with metaljet Ga-K $\alpha$ radiation (5). The Proteum2 program package was used for cell refinement and data reduction. ${ }^{3}$ All structures were solved by direct methods using SHELXT and refined by full-matrix least-squares on $\left|F^{2}\right|$ algorithm (SHELXL) ${ }^{4}$ using Olex2 program. ${ }^{5}$ Some solvent molecules in the crystal structure of $\mathbf{2}$ and 4-6 were omitted using SQUEEZE routing of PLATON program as they were highly disordered and could not be resolved unambiguously. Crystallographic data for 1-4 and 5-7 are given in Tables S1 and S2, respectively.

## Computational studies

Gaussian 09 packages ${ }^{6}$ was used to optimized the structure of 1 at the PBE level ${ }^{7,8}$ of density functional theory (DFT); the empirical dispersion correction of Grimme's DFT-D3 dispersion was applied. ${ }^{9}$ The $6-31 \mathrm{G}^{*}$ Pople basis set ${ }^{10,11}$ was chosen to describe C and H atoms and effective core potential (ECP) type basis set SDD was applied on Cu and Au atoms. ${ }^{12,13}$ To further refine the molecular orbital information, the solvent effect was included by the single point calculations for the optimized gas-phase structure with self-consistent reactions field (SCRF) based on the polarizable continuum model (CPCM) ${ }^{14}$ in which dichloromethane was the solvent.
