General Information

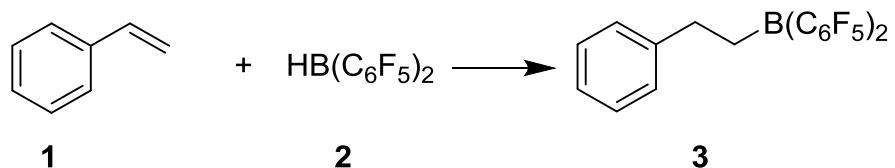

All experiments were carried out in a dry argon atmosphere using an MBraun glove box and/or standard Schlenk techniques. All solvents were dried and stored under an argon atmosphere before use. NMR spectra were measured on a Varian INOVA 500 MHz spectrometer (¹H 500 MHz; ¹³C, 126 Hz; ¹¹B, 160 MHz; ¹⁹F, 470 Hz) or a Varian UNITY plus 600 MHz spectrometer (¹H 600 MHz; ¹³C, 151 Hz; ¹¹B, 192 MHz; ¹⁹F, 564 Hz). Chemical shifts are given relative to SiMe₄ and referenced to the respective residual solvent signal (¹H NMR and ¹³C NMR) or an external standard [δ (BF₃·OEt₂) = 0 for ¹¹B NMR, δ (CFCl₃) = 0 for ¹⁹F NMR]. NMR assignments were supported by additional 1D and 2D NMR experiments. IR were measured on Varian 1300 FT-IR and melting points were measured on TA-instruments DSC Q-20.

Unless otherwise noted, all chemicals were purchased from commercially available sources. Compound **2** were prepared according to the literature.^{1,2} We prepared the aryldivinylphosphanes **8a-c** by treatment of the respective ArPCl₂ precursors with two molar equiv. of vinyl magnesium bromide.³⁻⁹ We had shown that the P/B/B system **11c** splits dihydrogen in the presence of the external base 'Bu₃P to give **12c**.¹⁰

X-Ray diffraction: For compounds **14c** and **18c** data sets were collected with a Nonius Kappa CCD diffractometer. Programs used: data collection, COLLECT (R. W. W. Hooft, Bruker AXS, **2008**, Delft, The Netherlands); data reduction Denzo-SMN (Z. Otwinowski, W. Minor, *Methods Enzymol.* **1997**, 276, 307-326); absorption correction, Denzo (Z. Otwinowski, D. Borek, W. Majewski, W. Minor, *Acta Crystallogr.* **2003**, A59, 228-234); structure solution SHELXS-97 (G. M. Sheldrick, *Acta Crystallogr.* **1990**, A46, 467-473); structure refinement SHELXL-97 (G. M. Sheldrick, *Acta Crystallogr.* **2008**, A64, 112-122). For compound **14b** data sets were collected with a Bruker APEX II CCD diffractometer. Data sets for the compounds **14a**, **17a** and **17b** were collected with a D8 Venture Dual Source 100 CMOS diffractometer. Programs used for compound **14a**: data collection: APEX3 V2016.1-0 (Bruker AXS Inc., **2016**); cell refinement: SAINT V8.37A (Bruker AXS Inc., **2015**); data reduction: SAINT V8.37A (Bruker AXS Inc., **2015**); absorption correction, SADABS V2014/7 (Bruker AXS Inc., **2014**); structure solution SHELXT-2015 (Sheldrick, **2015**); structure refinement SHELXL-2015 (Sheldrick, **2015**) and graphics, XP (Bruker AXS Inc., **2015**). R-values are given for observed reflections, and wR2 values are given for all reflections. *Exceptions and special features:* For compound **14a** one and a half badly disordered dichloromethane molecules, for compound **17a** a badly disordered dichloromethane molecule and for compound **18c** one toluene molecule were found in the asymmetrical unit and could not be satisfactorily refined. The program SQUEEZE (Spek, A.L. (2015). *Acta Cryst. C*71, 9-18) was therefore used to remove mathematically the effect of the solvent. The quoted formula and derived parameters are not included the squeezed solvent molecules.

CCDC deposition numbers are 1549697 to 1549702.

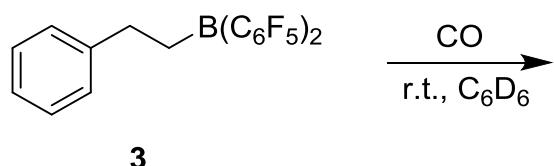

Preparation of compound 3

Scheme S1.

A solution of styrene **1** (145.8 mg, 1.4 mmol, 1.4 eq.) in pentane (6 mL) was added to a suspension of HB(C₆F₅)₂ **2** (345.9 mg, 1.0 mmol, 1 eq.) in pentane (2 mL) at room temperature. While stirring the reaction suspension became a clear solution and then a suspension. The precipitate was collected by filtration, then it was washed with cold pentane (2 mLx2, -30 °C) to give compound **3** as a white solid (320.0 mg, 0.71 mmol, yield 71 %).¹¹

Reaction of compound 3 with CO gas

Scheme S2.

A solution of compound **3** (22.5 mg, 0.05 mmol) in C₆D₆ (1 mL) was filled in a J-Young tube, which was cooled to -78 °C (dry ice / isopropanol bath) and then evacuated carefully. Then the reaction mixture was exposed to CO gas (1.5 bar) at room temperature. After storing for 24 h at room temperature, the mixture was characterized by NMR experiments.

Preparation of Compound **8a**⁴

Scheme S3.

In a flame dried Schlenk flask, a solution of 1,3-dichlorobenzene (2.35 g, 16 mmol, 1.0 eq.) in THF (30 mL) was cooled to -78 °C in a dry ice / isopropanol bath. *n*-BuLi (10 mL of a 1.6 M solution in *n*-hexane, 16 mmol, 1.0 eq.) was added dropwise and stirred at -78 °C for 2 h. A solution of MesMgBr (32 mmol, 2.0 eq.) in THF (40 mL), freshly prepared from magnesium (0.78 g, 32 mmol, 2.0 eq.) and mesyl bromide (6.37 g, 32 mmol, 2.0 eq.), was then added dropwise and stirred at -78 °C for 2 h. The solution was allowed to warm to room temperature and stirring continued for 12 h. The resulting solution was heated to reflux and stirred for 2 h. After cooling the mixture to -78 °C, PCl₃ (1.4 mL, 16 mmol, 1.0 eq.) was added and the reaction mixture was allowed to warm to room temperature and stirred for 24 h. After cooling the mixture to -78 °C again, vinylmagnesium bromide (32 mL of 1 M solution in THF, 32 mmol, 2.0 eq.) was added. The mixture was allowed to warm to room temperature and stirred at room temperature for 48 h. After removal of all volatiles in vacuo, the resulting mixture was extracted with pentane (100 mL × 3). The combined extraction was concentrated and purified by silica gel chromatography (pentane : dichloromethane : triethylamine = 200:10:1) to give compound **8a** as a white solid (3.57 g, 8.96 mmol, 56 %).

Crystals suitable for the X-ray crystal structure analysis were obtained by slow diffusion of pentane to a solution of compound **14a** in dichloromethane at -36 °C.

X-ray crystal structure analysis of compound 14a: A colorless plate-like specimen of C₄₀H₃₄BF₁₀P, approximate dimensions 0.044 mm x 0.206 mm x 0.388 mm, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured. A total of 342 frames were collected. The total exposure time was 6.65 hours. The frames were integrated with the Bruker SAINT software package using a narrow-frame algorithm. The integration of the data using a monoclinic unit cell yielded a total of 46282 reflections to a maximum θ angle of 25.03° (0.84 Å resolution), of which 7340 were independent (average redundancy 6.305, completeness = 99.9%, R_{int} = 15.27%, R_{sig} = 8.51%) and 4607 (62.77%) were greater than 2σ(F²). The final cell constants of $\underline{a} = 13.2212(8)$ Å, $\underline{b} = 16.1944(12)$ Å, $\underline{c} = 19.5088(13)$ Å, $\beta = 94.223(2)^\circ$, volume = 4165.7(5) Å³, are based upon the refinement of the XYZ-centroids of 5505 reflections above 20 σ(I) with $4.605^\circ < \theta < 50.76^\circ$. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.915. The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.9490 and 0.9940. The final anisotropic full-matrix least-squares refinement on F² with 479 variables converged at R1 = 6.07%, for the observed data and wR2 = 14.36% for all data. The goodness-of-fit was 1.020. The largest peak in the final difference electron density synthesis was 0.306 e⁻/Å³ and the largest hole was -0.285 e⁻/Å³ with an RMS deviation of 0.065 e⁻/Å³. On the basis of the final model, the calculated density was 1.190 g/cm³ and F(000), 1536 e⁻. The position of the hydrogen atom at P1 was refined freely; others hydrogen atoms were calculated and refined as riding atoms.

Crystals suitable for the X-ray crystal structure analysis were obtained from slow diffusion of pentane to a solution of compound **14b** in dichloromethane at -36 °C.

X-ray crystal structure analysis of compound 14b: A colorless plate-like specimen of C₃₁H₃₂BF₁₀P, approximate dimensions 0.030 mm x 0.180 mm x 0.300 mm, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured. A total of 1809 frames were collected. The total exposure time was 26.63 hours. The frames were integrated with the Bruker SAINT software package using a wide-frame algorithm. The integration of the data using a monoclinic unit cell yielded a total of 43312 reflections to a maximum θ angle of 67.37° (0.84 Å resolution), of which 5066 were independent (average redundancy 8.550, completeness = 96.5%, R_{int} = 9.19%, R_{sig} = 4.59%) and 3915 (77.28%) were greater than 2σ(F²). The final cell constants of $a = 17.6792(14)$ Å, $b = 8.5320(7)$ Å, $c = 19.5972(15)$ Å, $\beta = 99.052(4)$ °, volume = 2919.2(4) Å³, are based upon the refinement of the XYZ-centroids of 9978 reflections above 20 σ(I) with $6.261^\circ < \theta < 133.0^\circ$. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.770. The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.6450 and 0.9530. The final anisotropic full-matrix least-squares refinement on F² with 398 variables converged at R1 = 4.50%, for the observed data and wR2 = 10.02% for all data. The goodness-of-fit was 1.035. The largest peak in the final difference electron density synthesis was 0.287 e/Å³ and the largest hole was -0.336 e/Å³ with an RMS deviation of 0.054 e/Å³. On the basis of the final model, the calculated density was 1.448 g/cm³ and F(000), 1312 e⁻. The position of the hydrogen atom at P1 was refined freely; others hydrogen atoms were calculated and refined as riding atoms.

Scheme S7.

In a Schlenk flask, a solution of compound **8b** (11.5 mg, 0.04 mmol, 1.0 eq.) and compound **2** (29.0 mg, 0.084 mmol, 2.1 eq.) in pentane (2 mL) was stirred at room temperature for 12 h. Then the mixture was filtered. After the solution was filled in a J-Young tube which was cooled to -78 °C (dry ice / isopropanol bath), it was evacuated carefully. Then the dry ice bath was removed and the reaction mixture was exposed to H₂ gas (1.5 bar). The formed suspension was kept at room temperature for 16 h. Then the supernatant was removed by decantation and the collected solid was dissolved in dichloromethane-d₂ (1 mL).

Synthesis of compound **14c**

Scheme S8.

In a Schlenk flask, a solution of compound **8c** (99.1 mg, 0.30 mmol, 1.0 eq.) and compound **2** (207.6 mg, 0.6 mmol, 2.0 eq.) in dichloromethane (6 mL) was stirred at room temperature for 15 min to give a yellow solution. After the solution was cooled to -78 °C (dry ice / isopropanol bath) and the flask was evacuated carefully, the dry ice bath was removed and the reaction mixture was exposed to H_2 gas (1.5 bar). Subsequently the formed suspension was stirred at room temperature for 30 min, then the H_2 was released under argon atmosphere followed by the addition of pentene (42.1 mg, 0.6 mmol, 2 eq.). The reaction mixture was stirred at room temperature for 2 days until the precipitate had dissolved again. Then all volatiles were removed in vacuo to give a white solid which was washed with pentane (2 mL × 3) and dried in vacuo to give compound **14c** as a white solid (140.4 mg, 0.207 mmol, 69 % yield).

The combined washing solutions were collected and pyridine (23.7 mg, 0.3 mmol, 1.0 eq.) was added. The mixture was stored at -36 °C to give compound **15py** as a white solid (89.1 mg, 0.180 mmol, 60 % yield). The obtained NMR data of compound **15py** were consistent with those listed above (page 49).

Preparation of compound 17b

Scheme S11.

In a Schlenk flask, compound **8b** (57.7 mg, 0.20 mmol, 1.0 eq.) and compound **2** (145.3 mg, 0.42 mmol, 2.1 eq.) were mixed with pentane (6 mL) and stirred at room temperature for 24 h. After the reaction mixture was filtered via cannula, the obtained solution was cooled to -78 °C (dry ice / isopropanol bath) and then the flask was evacuated carefully. Then the dry ice bath was removed and the solution was exposed to CO gas (1.5 bar) and stirred at room temperature for 30 min to give a white suspension. Filtration by using a filter cannula gave a white solid. The white solid was washed with pentane (1 mL × 2) and dried in vacuo to finally give compound **17b** as a white solid (107.6 mg, 0.054 mmol, 54 %).

Crystals suitable for the X-ray crystal structure analysis of compound 17b were obtained from slow diffusion of pentane to a solution of the white solid in dichloromethane at -36 °C.

X-ray crystal structure analysis of compound 17b: A prism-like specimen of C₈₈H₆₂B₄F₄₀O₂P₂, approximate dimensions 0.093 mm x 0.161 mm x 0.223 mm, was used for the X-ray crystallographic analysis. The X-ray intensity data were measured. A total of 1327 frames were collected. The total exposure time was 14.74 hours. The frames were integrated with the Bruker SAINT software package using a narrow-frame algorithm. The integration of the data using a triclinic unit cell yielded a total of 80163 reflections to a maximum θ angle of 26.37° (0.80 Å resolution), of which 17300 were independent (average redundancy 4.634, completeness = 99.8%, R_{int} = 4.21%, R_{sig} = 3.78%) and 13572 (78.45%) were greater than 2σ(F²). The final cell constants of a = 11.1630(5) Å, b = 16.2067(8) Å, c = 24.8378(11) Å, α = 76.4320(10)°, β = 87.505(2)°, γ = 76.034(2)°, volume = 4238.6(3) Å³, are based upon the refinement of the XYZ-centroids of 9782 reflections above 20 σ(I) with 4.756° < 2θ < 54.95°. Data were corrected for absorption effects using the multi-scan method (SADABS). The ratio of minimum to maximum apparent transmission was 0.958. The calculated minimum and maximum transmission coefficients (based on crystal size) are 0.9590 and 0.9830. The structure was solved and refined using the Bruker SHELXTL Software Package, using the space group P-1, with Z = 2 for the formula unit, C₈₈H₆₂B₄F₄₀O₂P₂. The final anisotropic full-matrix least-squares refinement on F² with 1237 variables converged at R1 = 3.90%, for the observed data and wR2 = 8.60% for all data. The goodness-of-fit was 1.024. The largest peak in the final difference electron density synthesis was 0.452 e/Å³ and the largest hole was -0.361 e/Å³ with an RMS deviation of 0.056 e/Å³. On the basis of the final model, the calculated density was 1.580 g/cm³ and F(000), 2032 e⁻.

Stability of compound **17b** in benzene-d₆ at 80 °C

Scheme S19.

Compound **17b** (white solid, 15 mg) was mixed with benzene-d₆ (1 mL) in a J-Young tube at room temperature (suspension). The suspension in J-Young tube was heated at 80 °C for 6h to give a colorless solution which were characterized by NMR experiments.

Control experiment: (1) Compound **17b** (white solid, 15 mg) in dichloromethane-d₂ (the solubility of compound **17b** in benzene-d₆ is too low for the measurements). (2) In a Schlenk flask, a solution of compound **8b** (14.4 mg, 0.05 mmol, 1.0 eq.) and compound **2** (35.5 mg, 0.1026 mmol, 2.05 eq.) in benzene-d₆ (1 mL) were stirred for 12 h at room temperature. After filtration, a colorless solution of compound **11b** was obtained and analyzed by NMR experiments.

Formation of Macrocyclic Ring Systems by Carbonylation of Trifunctional P/B/B Frustrated Lewis Pairs

All density functional theory (DFT) calculations were performed by employing Turbomole 7.0¹² software. The structures were optimized at the composite PBEh-3c DFT level of theory.¹³ Harmonic vibrational frequency calculations were conducted at the same level to characterize the nature of the stationary points along the reaction coordinates: no imaginary frequencies were found for the local minima, and one and only one imaginary frequency for the transition states. The thermostatistical contributions to the free energy in the gas phase were obtained from a modified rigid-rotor-harmonic oscillator approximation¹⁴ at temperatures of 298.15 and 373.15 K, respectively, and for 1 atm pressure. The density-fitting RI-J^{15,16} approach for the Coulomb integrals was used to accelerate the geometry optimization and frequencies calculations. Accurate electronic energies were obtained from single point calculations at the PW6B95 level¹⁷ upon the optimized structures, with the BJ-damped variant of the D3 dispersion correction^{18,19} in conjunction with the def2-TZVP basis set.^{20,21} The COSMO-RS (Conductor-like Screening Model for Real Solvents) solvation model^{22,23} was used to compute the solvation Gibbs free energies by employing the gas-phase optimized structures, and with toluene as the solvent. These calculations were done with the COSMOtherm program.²⁴ The final Gibbs free energies in solution were calculated from the gas-phase single point electronic energies plus the gas-phase thermal contributions, and the COSMO-RS solvation Gibbs free energies.

To understand the importance of the ‘second’ borane, we computed Gibbs free energy for the CO insertion step with and without the ancillary borane, respectively (Fig S96). The results show that the addition of the second borane changes the thermodynamics of the CO insertion step. For example, a typical FLP could capture the CO, but CO can not be inserted into the C-B bond because the computed ΔG is 11.4 kcal mol⁻¹. After introducing the second borane, the CO inserting becomes possible with a computed ΔG of -4.3 kcal mol⁻¹.

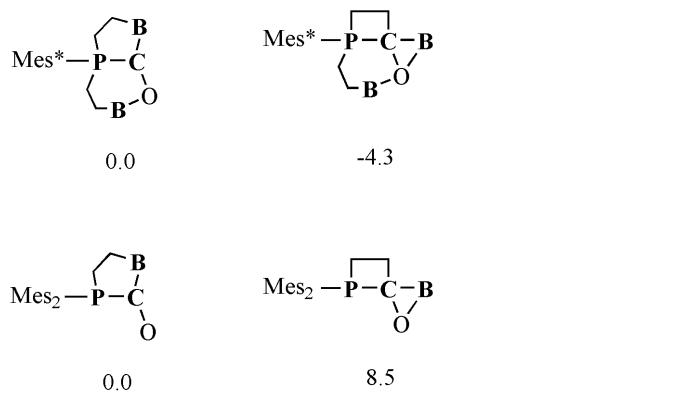

Figure S96. Computed Gibbs free energies at PW6B95-D3/def2-TZVP (COSMO-RS, toluene)//PBEh-3c level of the theory (in kcal mol⁻¹).

To evaluate whether the observed cyclodimers/trimers might be kinetic or thermodynamic products, we computed the Gibbs free energies for alternative dimer or trimer formation in the cases of Mes* and Tipp (see Fig S97). In the Mes*-case the trimer is energetically more stable than the dimer (-16.0 v.s -6.2 kcal mol⁻¹ per one monomer molecule). In the case of Tipp, the dimer is energetically more stable than the trimer (-12.9 v.s -7.6 kcal mol⁻¹ per one monomer molecule).

Part 3. Solid State NMR Experiments

Formation of Macrocyclic Ring Systems by Carbonylation of Trifunctional P/B/B Frustrated Lewis Pairs

Experimental Procedures

Solid state MAS-NMR studies were conducted on a Bruker Avance III 300 (^1H 300.1 MHz, 7.05 T) and a Bruker DSX 500 (^1H 500 MHz, 11.74 T) spectrometer using a rotational frequency of 12.5 kHz in 4 mm NMR double and triple resonance probes.

For quantitative analysis the ^{11}B -MAS NMR spectra were measured using short pulses in the range of 0.5-0.7 μs to achieve uniform excitation and a relaxation delay between 10 and 20 s. During acquisition proton decoupling was performed (SWFTPPM15 57 kHz RF-Power).

The ^{31}P -CPMAS NMR spectra were conducted using a 5.9 μs (7.05 T) / 4.8 μs (11.74 T) $\pi/2$ pulse on ^1H (42/53 kHz RF-Power) for excitation followed by 750 μs spinlock pulse ramped on ^1H from 90/70 to 100% to a maximum nutation frequency of 42/53 kHz. A recycle delay of 3 s was sufficient. During acquisition proton decoupling was performed (SWFTPPM15 60/53 kHz RF-Power). Additionally SWFTPPM15 decoupling of ^{11}B (45 kHz RF-Power) partially was applied to enhance resolution.

For direct excitation of phosphorous in ^{31}P MAS NMR experiments a 5.2 μs pulse (48 kHz RF-Power) was applied followed by a relaxation delay of 60 s (**18c**) and 800 s (**17b**) respectively. During acquisition proton decoupling was performed (SWFTPPM15 60 kHz RF-Power).

$^{11}\text{B}\{^{31}\text{P}\}$ J-resolved NMR spectra were acquired using a ^{11}B excitation pulse of 5 μs and reconversion pulses of 10 μs for boron and 10.4 μs for phosphorous. After evolution a z-filter was utilized. During evolution and acquisition ^1H decoupling was performed (SWFTPPM15 42 kHz RF-Power). A relaxation delay of 4 s was sufficient.

For $^{11}\text{B}\{^{31}\text{P}\}$ CP-INEPT experiments the parameters from ^{31}P -CPMAS NMR experiments were used. To selectively excite the central transition soft refocusing pulses of 14 μs (35 kHz RF-Power) were applied on the boron channel. Proton decoupling was performed during evolution and acquisition (SWFTPPM15 60 kHz RF-Power) followed by a relaxation delay of 2 s.

Spectral deconvolution was done with DMFIT software (version 2011)²⁵

DFT calculation of NMR parameters were conducted using crystal structures obtained by x-ray diffraction. Chemical shifts calculation were performed with TURBOMOLE (version 6.5)²⁶⁻²⁷ using B3LYP²⁸⁻²⁹ as functional in combination with a def2-SVP basis set for **18c** and a def2-TZVP basis set²⁰ for **17c** (less computational effort). Quadrupolar coupling parameters were calculated on a GGA DFT level using GAUSSIAN (version GAUSSIAN09)³⁰ and the B97-D functional³¹. Here for both molecules the def2-TZVP basis set obtained from EMSL database³²⁻³³ could be used with additional functions for boron from the cc-pCVTZ basis set³⁴⁻³⁵ to enhance the accuracy near the nucleus.

[a] Calculated shifts assigned to the species in such a way that the trend form high to low shift values is matched. Quadrupolar parameters of ^{11}B were assigned to the respective species.

[b] ^{31}P species listed in table 2 assigned to boron species using $^{11}\text{B}\{^{31}\text{P}\}$ CP-INEPT NMR data.

Table S4: ^{31}P parameters obtained via line shape deconvolution of $^{31}\text{P}\{^1\text{H}\}$ CPMAS NMR spectra of **18c-batch 1** depicted in figure S106-S109. Estimated errors: ± 0.2 ppm and ± 2 Hz for $\delta_{\text{CS}}^{\text{iso}}$ and J , respectively.
