## Experimental

### *Materials synthesis*

TaO<sub>2</sub>F/<sup>g</sup>C was synthesized by a ion adsorbed method: macroreticular weak basic styrene type anion exchange resin (10 g, D301, AR, > 99%, Shanghai Hualing Co. Ltd., China) was firstly adsorbed with sodium hexanitrocobaltate (1000 mL, 0.1 M Na<sub>3</sub>Co(NO<sub>2</sub>)<sub>6</sub>, Aladding Chemistry Co. Ltd., China) solution. Then, the resin complex was stirred with potassium heptafluorotantalate (1.39 mM K<sub>2</sub>TaF<sub>7</sub>, Aladding Chemistry Co. Ltd., China) in 500 mL hot water for 5 hours. The resulting resin complex was then sintered at 1000 °C for 2 h under a pure N<sub>2</sub> flow. After slowly cooling down to room temperature, the product was ground and treated with 1 mol L<sup>-1</sup>

HCl solution to remove cobalt and other impurities. After washing in deionized water and drying, TaO<sub>2</sub>F/gC catalysts were stored for further characterizations.

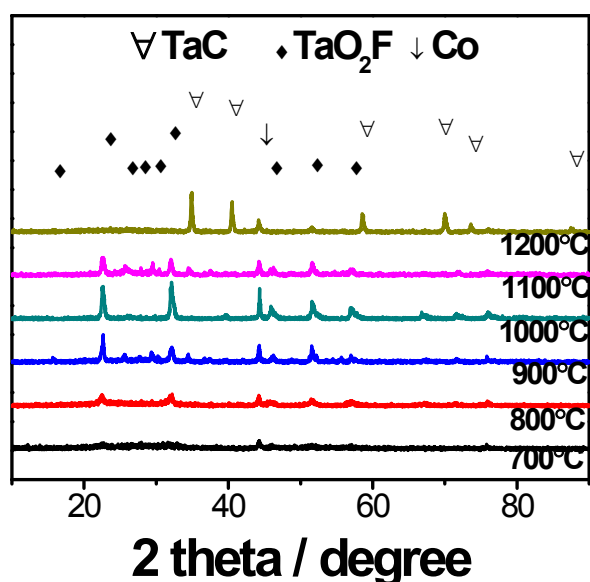

As known, various tantalum compounds are insoluble and tantalum based chlorides and fluorides are best candidates as tantalum precursor for the same synthesizing process in this work<sup>S1</sup>. This is the reason why various Ta<sub>2</sub>O<sub>5</sub> supported on carbon materials were synthesized through physical mixing methods<sup>S2-S4</sup>. Therefore, Ta<sub>2</sub>O<sub>5</sub>/CC (Ta<sub>2</sub>O<sub>5</sub> supported on CC) was synthesized through a direct ball milling method: 317 mg Ta<sub>2</sub>O<sub>5</sub> powder and 683 mg CC were treated by ball-milling for 6 h. Then, the product was treated with 1 mol L<sup>-1</sup> HCl solution to remove impurities and washed in deionized water and drying.

### ***Characterizations***

X-ray diffraction (XRD) measurements were carried out on a D/Max-III A (Rigaku Co., Japan) employing Cu K $\alpha$  ( $\lambda$ = 0.15406 nm) as the radiation source at 40 kV and 40 mA with a scanning rate of 8° min<sup>-1</sup>. Morphologies of TaO<sub>2</sub>F/gC were observed by Transmission Electron Microscopy (TEM) investigations on a FEI Tecnai G2 F30 operating at 300 kV. Raman analysis was performed on a micro-Raman spectrometer (Renishaw inVia, U.K.). X-ray photoelectron spectroscopy (XPS) measurements were carried out on a XPS apparatus (ESCALAB 250, Thermo-VG Scientific Ltd.). The thermal gravimetric (TG) analysis was carried out on Thermogravimetry coupled with Fourier transform infrared spectrometry (NETZSCH-Feinmahltechnik GmbH, Selb).

### ***Electrochemical measurements***

Electrochemical measurements were conducted on a Bio-Logic VMP3 potentiostat in a three-electrode cell by using a reversible hydrogen electrode (RHE) as the reference electrode and a graphite rod as the counter electrode. The working electrode was a glassy carbon electrode with diameter of 5 mm ( $\phi = 5$  mm). TaO<sub>2</sub>F/gC, KTaO<sub>3</sub> (CAS: 12030-91-0), Ta<sub>2</sub>O<sub>5</sub> (CAS: 1314-61-0) and CC electrocatalysts (10.0 mg) were dispersed in 1.5 mL ethanol and 0.5 mL Nafion (0.5 wt%, DuPont, USA) solution, respectively. The resulting mixture was then ultrasonicated for 45 min until obtain a well dispersed ink. Electrocatalysts ink was transferred to the surface of the work electrode. Then, to obtain an electrocatalysts thin film on electrode, the work electrode was dried under infrared lamp. Loadings of electrocatalysts on work electrode were 2.55 mg cm<sup>-2</sup>. The electrochemical tests were performed in 1 M HClO<sub>4</sub> solution at 25 °C.

**Fig. S1** XRD patterns of resin complexes sintered at different temperature under N<sub>2</sub> atmosphere.

XRD patterns of  $\text{Ta}_2\text{O}_5$  and  $\text{Ta}_2\text{O}_5/\text{CC}$  were shown in Fig. S2a, indicating that the  $\text{Ta}_2\text{O}_5$  phase is not changed after ball-milling process and impurities, such as iron, has been removed. Graphite (002) peak is too weak to be observed from XRD pattern.

**Fig. S2** XRD patterns of (a)  $\text{Ta}_2\text{O}_5/\text{CC}$  and  $\text{Ta}_2\text{O}_5$ , (b)  $\text{KTaO}_3$  and (c) CC.

XPS spectra of  $\text{KTaO}_3$  were shown in Fig. S3. Doublet binding energy (BE) peaks position at 26.3 and 28.3 eV are assigned to  $\text{Ta}_{7/2}$  and  $\text{Ta}_{5/2}$  orbitals, indicating the existence of Ta-O bond identical to that of tantalum oxides<sup>S5</sup>. The peak position at ~ 501 eV in O 1s spectrum corresponds to Ta-O bond<sup>S6, S7</sup> (Fig. S3b). The peak position at 293.3 eV and 295.5 eV are attributed to the K-O bond in K 2p spectrum<sup>S8</sup> (Fig. S3c). F element has been not found in F 1s spectrum (Fig. S3d).

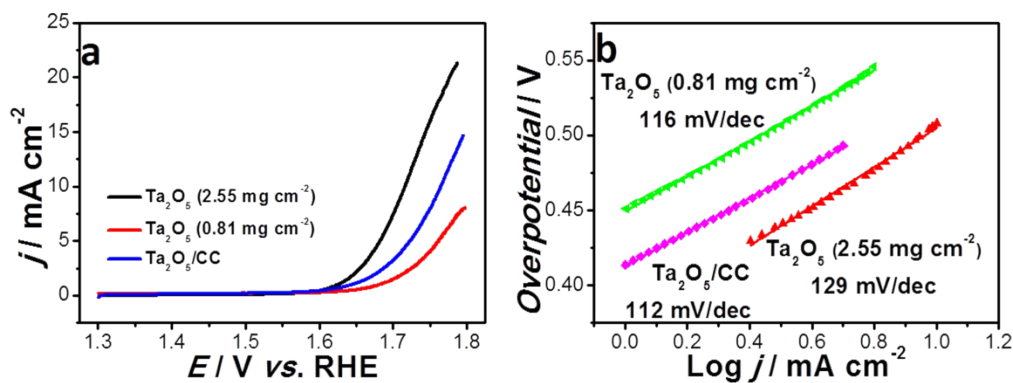

**Fig. S3** XPS Spectra of  $\text{KTaO}_3$ .

XPS spectra of  $\text{Ta}_2\text{O}_5$  were shown in Fig. S4. Doublet binding energy (BE) peaks position at 26.3 and 28.3 eV are assigned to  $\text{Ta}_{7/2}$  and  $\text{Ta}_{5/2}$  orbitals, indicating the existence of Ta-O bond identical to that of tantalum oxides<sup>S5</sup>. The peak position at ~ 501 eV in O 1s spectrum corresponds to Ta-O bond<sup>S6, S7</sup> (Fig. S4b).

**Fig. S4** XPS spectra of  $\text{Ta}_2\text{O}_5$ .

Loadings of electrocatalysts on electrode were  $2.55 \text{ mg cm}^{-2}$  in this work. However, as active composition, the loading of  $\text{TaO}_2\text{F}$  on  $\text{gC}$  was 31.7%, proved by TG analysis, indicating that loadings of  $\text{TaO}_2\text{F}$  on electrode was  $\sim 0.81 \text{ mg cm}^{-2}$ . For comparison,  $\text{Ta}_2\text{O}_5$  (with loadings on electrode of 0.81 and  $2.55 \text{ mg cm}^{-2}$ ) and  $\text{Ta}_2\text{O}_5/\text{CC}$  (with loadings of  $\text{Ta}_2\text{O}_5$  on electrode of  $0.81 \text{ mg cm}^{-2}$ ) as electrocatalysts for OER was measured in 1 M KOH with scan rate of  $1 \text{ mV s}^{-1}$  at  $25 \text{ }^\circ\text{C}$  (Fig. S5a). All polarization curves have been  $iR$ -corrected. Onset potentials of  $\text{Ta}_2\text{O}_5$  with different loadings were as same as  $\text{Ta}_2\text{O}_5/\text{CC}$  ( $1.58 \text{ V vs. RHE}$ ). However, the current density of  $\text{Ta}_2\text{O}_5/\text{CC}$  at  $1.80 \text{ V vs. RHE}$  is  $14.7 \text{ mA cm}^{-2}$ , larger than that of  $\text{Ta}_2\text{O}_5$  ( $9.0 \text{ mA cm}^{-2}$ , with loadings on electrode of  $0.81 \text{ mg cm}^{-2}$ ). It means that CC with better conductivity improves charge transfer properties of electrocatalysts and promotes the catalytic activity for OER on  $\text{Ta}_2\text{O}_5$ . Furthermore, Tafel slope of  $\text{Ta}_2\text{O}_5/\text{CC}$  is  $112 \text{ mV/dec}$ , as same as  $\text{Ta}_2\text{O}_5$  ( $0.81 \text{ mg cm}^{-2}$ ) ( $116 \text{ mV/dec}$ ). However, the exchange current density ( $j_0$ ) of  $\text{Ta}_2\text{O}_5/\text{CC}$  is  $2.097 \times 10^{-4} \text{ mA cm}^{-2}$ , significantly larger than that of  $\text{Ta}_2\text{O}_5$  ( $0.81 \text{ mg cm}^{-2}$ ) ( $1.346 \times 10^{-4} \text{ mA cm}^{-2}$ ) indicating improvement of catalytic activity by supporting on conductive carbon materials (Fig.S5b).

**Fig. S5** (a) Polarization curves of  $\text{Ta}_2\text{O}_5$  (with loadings on electrode of 0.81 and  $2.55$

mg cm<sup>-2</sup>) and Ta<sub>2</sub>O<sub>5</sub>/CC electrocatalysts for OER in 1 M KOH with scan rate of 1 mV s<sup>-1</sup> at 25 °C, (b) Tafel plots of Ta<sub>2</sub>O<sub>5</sub> (with loadings on electrode of 0.81 and 2.55 mg cm<sup>-2</sup>) and Ta<sub>2</sub>O<sub>5</sub>/CC electrocatalysts for OER.

Ta<sub>2</sub>O<sub>5</sub>/CC electrocatalysts exhibited lowest R<sub>ct</sub> value (726 Ω at 1.60 V vs. RHE and only 13 Ω at 1.80 V vs. RHE) than Ta<sub>2</sub>O<sub>5</sub>, indicating much faster electron transportation on Ta<sub>2</sub>O<sub>5</sub>/CC electrocatalysts, attributing to high conductivity of CC (Fig. S6e). Conductive CC has been found to promote catalytic activity of Ta<sub>2</sub>O<sub>5</sub> by improvement of charge transfer property. However, the onset potential and Tafel slope of Ta<sub>2</sub>O<sub>5</sub>/CC were not improved. It means that the intrinsic catalytic activity of Ta<sub>2</sub>O<sub>5</sub> play a more important role in catalytic reaction.

**Fig. S6** Nyquist plots and fittings for impedance response of  $Ta_2O_5/CC$ ,  $Ta_2O_5$ ,  $KTaO_3$  and  $CC$  electrocatalysts for OER. (e) relationship between charge-transfer resistance ( $R_{ct}$ ) and overpotential of  $Ta_2O_5/CC$  and  $Ta_2O_5$  electrocatalysts for OER,.

**Fig. S7** A two-time constant model for fitting the EIS response of OER.

**Table S1** OER performances of various transition metal oxides.
