## Methods

*SCLC measurement:* The hole and electron mobilities of the all-polymer blends were measured by the SCLC method using ITO/PEDOT:PSS/polymer blends/Au and ITO/ZnO/polymer blends/LiF/Al devices, respectively. Current-voltage measurements in the range of 0-8 V were taken, and the results were fitted to a space-charge-limited function. The SCLC is described by:

$$J_{SCLC} = \frac{9}{8} \epsilon \epsilon_0 \mu \frac{V^2}{L^3} \quad (1)$$

where  $\epsilon_0$  is the permittivity of free space ( $8.85 \times 10^{-14}$  F cm<sup>-1</sup>),  $\epsilon$  is the relative dielectric constant of the active layer (3.2 for PBDTTTPD and P(NDI2HD-T) and 3.9 for fullerene),  $\mu$  is the mobility of the charge carriers,  $V$  is the potential across the device ( $V = V_{\text{applied}} - V_{\text{bi}} - V_r$ ), and  $L$  is the active layer thickness. The series and contact resistances of the device (15-25  $\Omega$ ) were measured using blank devices (ITO/PEDOT:PSS/Au and ITO/ZnO/LiF/Al, respectively), and the voltage drop caused by this resistance ( $V_r$ ) was subtracted from the applied voltage.

*Multivariate Curve Resolution with Alternating Least Squares (MCR-ALS):* The purpose of the analysis is to use soft-modeling (physical constraints) to find the best possible component spectra for excited-state species to describe the TA surface and derive the resulting kinetics for each species. This analysis is detailed in the previous paper<sup>1</sup> and utilized in the following papers<sup>2,3</sup>. The TA surface for  $p$  excited-state species is described by  $D = CS + E$ , where  $D$  is a  $m$  by  $n$  TA data matrix,  $C$  is a  $p$  x  $n$  concentration profile (kinetics) matrix, and  $S$  is the  $m$  by  $p$  spectral profile matrix, and  $E$  is the error matrix. Initial  $S$  matrix is built from a guess of spectral profiles, specifically the singlet exciton absorption profile for the neat PBDTTTPD film. Then

using least squares the concentration profiles are calculated and constraints of non-negativity are applied. Then the spectral profiles are solved for using least squares and constraints of non-negativity, unimodality, and fixed known singlet exciton spectra are applied. Then a mean-squared error (MSE) is determined. If the MSE is within tolerance then the alternating least squares (ALS) process halts and the spectra and kinetic components are determined. If the MSE is not within the tolerance, then the ALS process is repeated until the MSE converges or reaches the specified tolerance. To improve analysis results, multiple normalized TA surfaces can be concatenated to form an augmented matrix described by the same  $p$  spectral profiles, which in our case of SE and CS profiles. We created an augmented matrix from the four measurements of the 0, 6, 12, and 24 hour exposure samples and the other three measurements from the fluence dependent measurements on the 0 hour sample.

*Polaron Generation Modeling:* To determine if formation times of polarons in all-PSC for different solar illumination times, we fit the first 100 ps to a bi-exponential function

$$N_{CS}(t) = A_1 \left( 1 - e^{-\frac{t}{\tau_1}} \right) + A_2 \left( 1 - e^{-\frac{t}{\tau_2}} \right) \quad (2)$$

where  $A_1$  and  $A_2$  are represent the proportions of sub-picosecond,  $\tau_1$ , and picosecond,  $\tau_2$ , charge generation, respectively. Similarities in the polaron formation analysis for varied solar illumination in Table S2 show no indication of change with solar illumination.

## Supplementary Figures

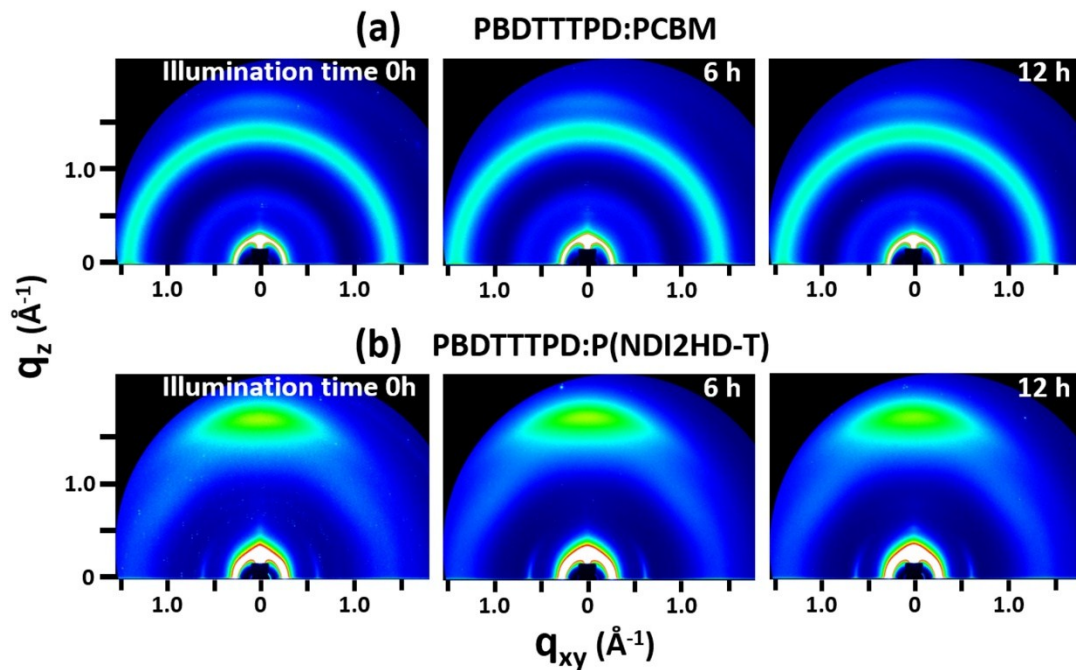

**Table S1.** Photovoltaic Characteristics for PBDTTTPD:PCBM and PBDTTTPD:P(NDI2HD-T) devices.

<b>Electron acceptors</b>	<b>ABL</b>	<b><math>V_{oc}</math> (V)</b>	<b><math>J_{sc}</math> (mA cm<sup>-2</sup>)</b>	<b><math>FF</math></b>	<b>PCE<sup>a</sup> (%)</b>
PCBM	MoO <sub>3</sub>	0.96	10.13	0.54	5.24
P(NDI2HD-T)	MoO <sub>3</sub>	1.03	10.77	0.59	6.55
PCBM	PEDOT:PS S	0.90	8.40	0.50	3.81
P(NDI2HD-T)	PEDOT:PS S	1.00	9.30	0.51	4.75

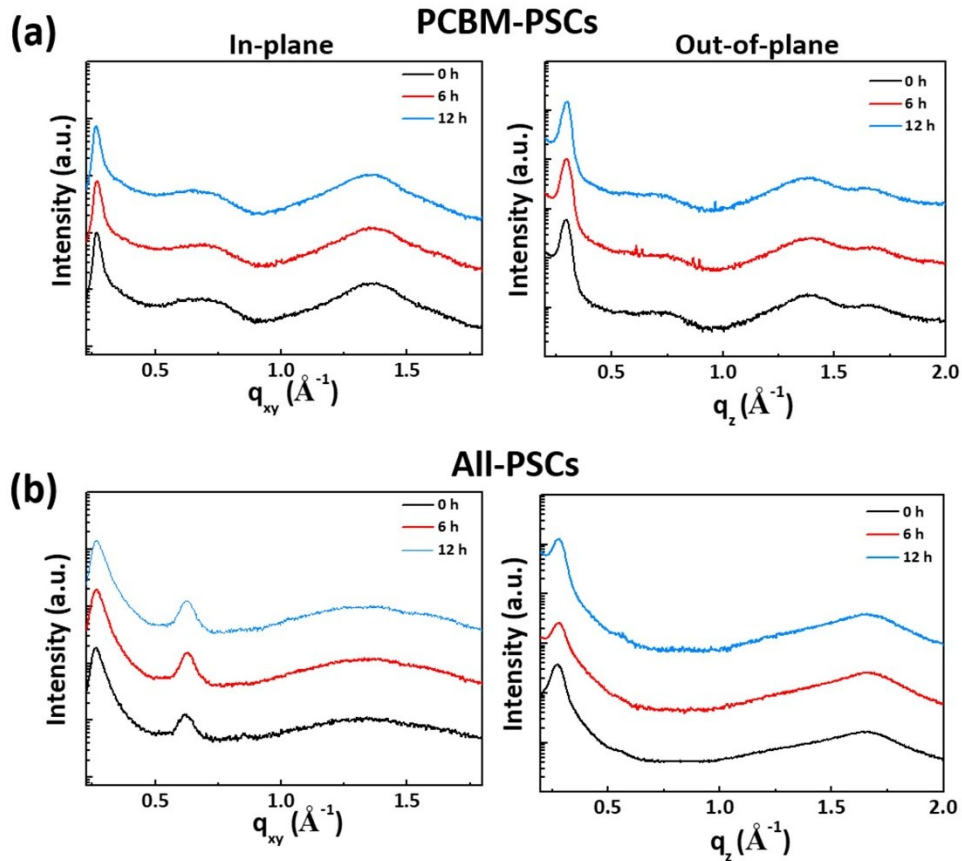

<sup>a</sup> Photovoltaic characteristics obtained under AM 1.5 G-simulated solar illumination (100 mW cm<sup>-2</sup>).

**Figure S1.** Optical microscope images showing morphology changes in the optimized active layer of PBDTTTPD:PCBM and PBDTTTPD:P(NDI2HD-T) blend films before (**a** and **b**) and after (**c** and **d**) 12 h illumination under one sunlight, respectively. No morphological changes were observed for both films after illumination.

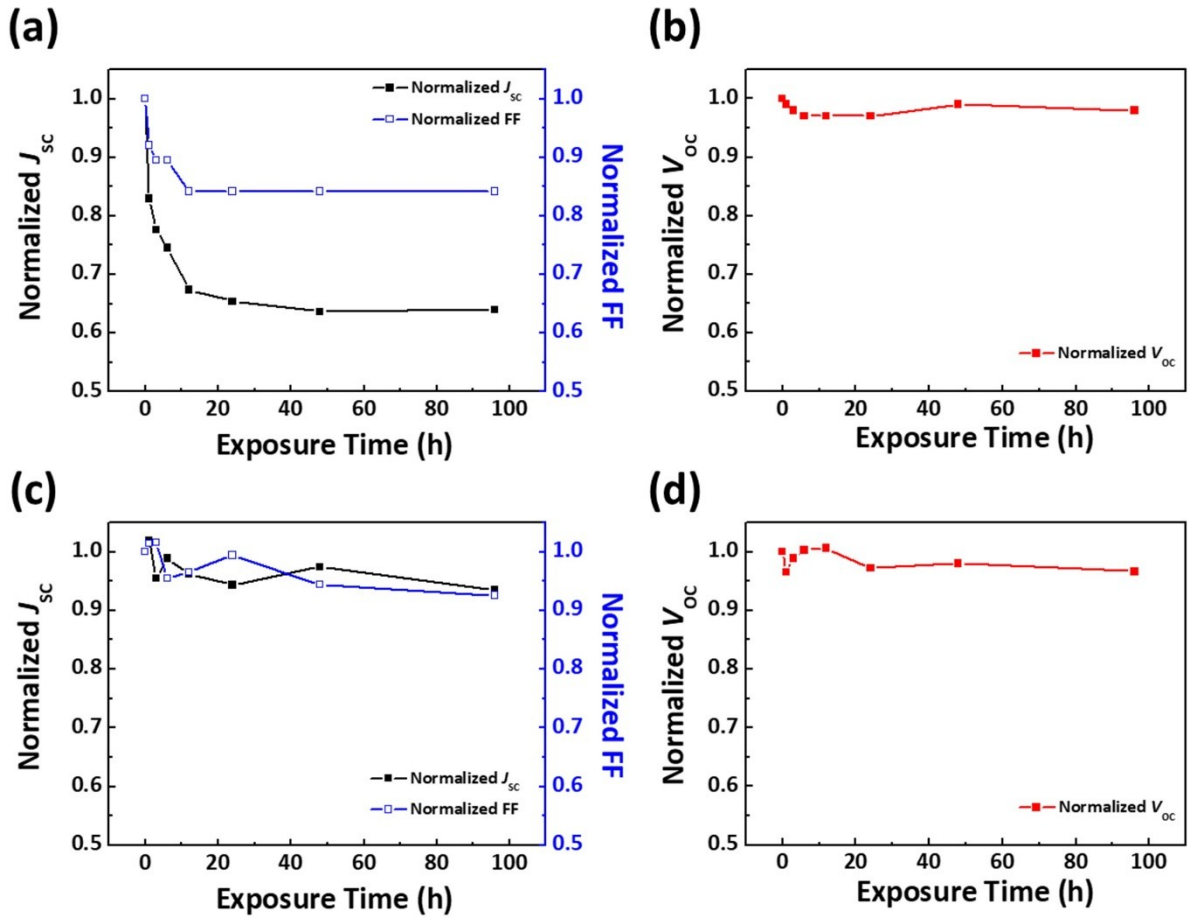

**Figure S2.** 2D GIXS images of (a) PCBM-PSCs and (b) all-PSCs blends under one sunlight illumination for different times.

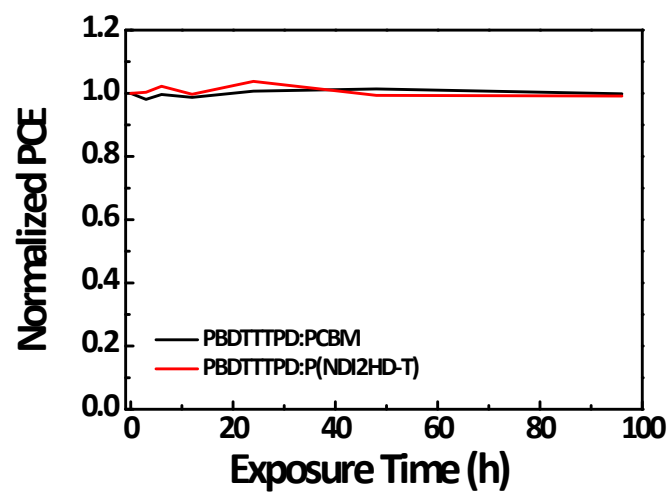

**Figure S3.** GIXS linecuts in the in-plane and out-of-plane directions for (a) PBDTTTPD:PCBM and (b) PBDTTTPD:P(NDI2HD-T) blend films under one sunlight illumination for different times.

Before illumination, the BHJ blend of the PBDTTTPD:PCBM exhibited prominent a (010) peak at  $q_z \approx 1.7 \text{ \AA}^{-1}$  in the out-of-plane direction, corresponding to the  $\pi$ - $\pi$  stacking of PBDTTTPD, indicating the preferential face-on orientation of the donor polymer relative to the substrate. In addition, diffuse halos ( $q \approx 0.7$  and  $q \approx 1.4 \text{ \AA}^{-1}$ ) from amorphous PCBM molecules were observed. In the case of all-PSC, both the PBDTTTPD and P(NDI2HD-T) exhibited a prominent (010)  $\pi$ - $\pi$  stacking peaks in the out-of-plane direction, while the (100) lamellar peaks ( $q_{xy} \approx 0.27 \text{ \AA}^{-1}$ ) of the PBDTTTPD and P(NDI2HD-T) and the (001) peak ( $q_{xy} \approx 0.6 \text{ \AA}^{-1}$ ) of the P(NDI2HD-T) polymer were observed in the in-plane direction, suggesting that the two polymers are preferentially orientated to face-on directions.<sup>4</sup> After illumination, in both PSC systems, the locations and intensities of the scattering peaks were not altered, indicating their polymer packing structures and the face-on geometry were well preserved. Therefore, the photo-degradation in the device performance of the PBDTTTPD:PCBM is not associated with the morphological and structural changes of the active layer.

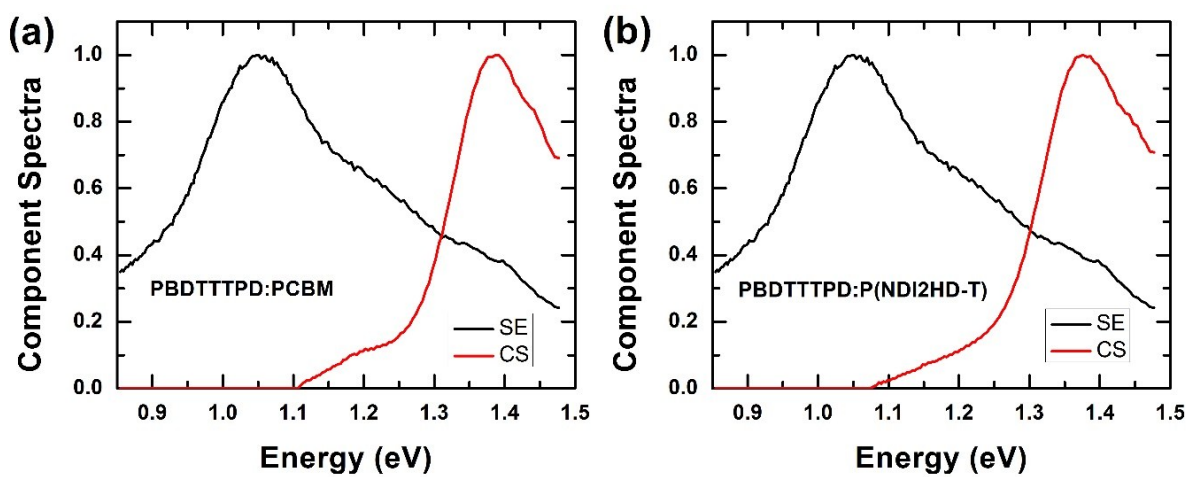

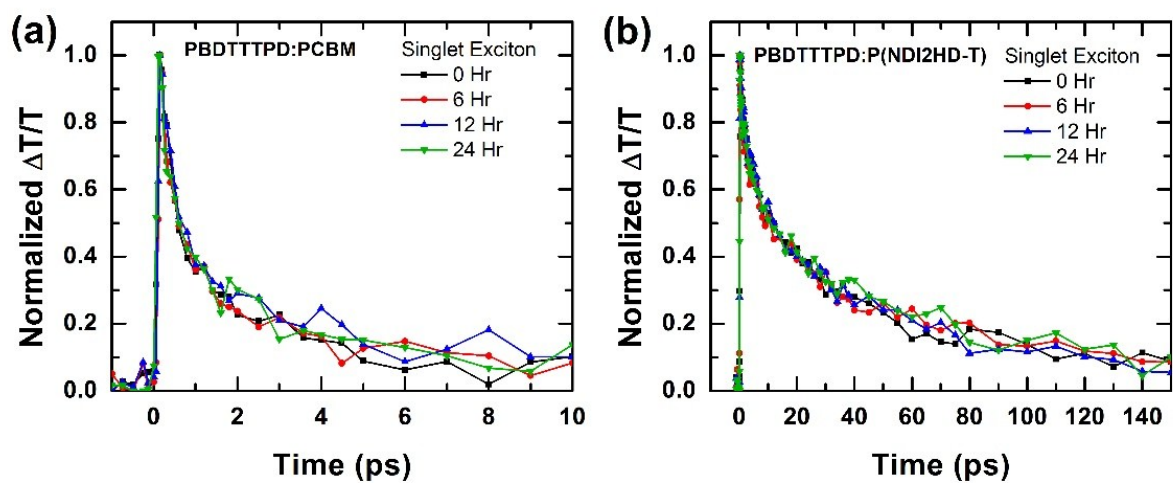

**Figure S4.** Normalized  $J_{sc}$  and FF of (a) PCBM-PSCs and (c) all-PSCs and normalized  $V_{oc}$  of (b) PCBM-PSCs and (d) all-PSCs as function of illumination times.

**Figure S5.** Normalized efficiencies of PCBM- and all-PSCs measured in dark condition.

**Figure S6.** TA component spectra from MCR-ALS analysis for (a) PBDTTTPD:PCBM and (b) PBDTTTPD:PNDI2HDT films.

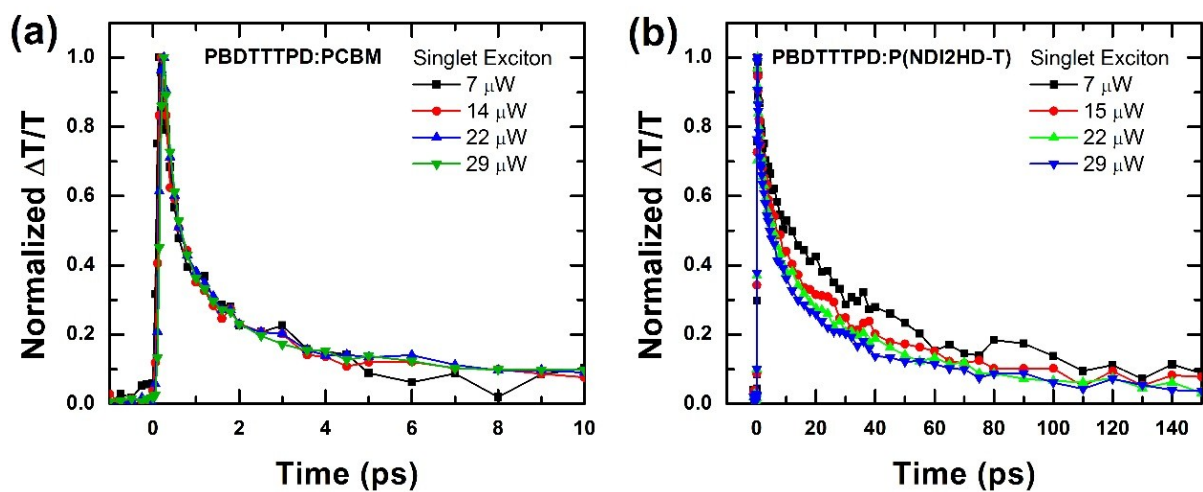

**Figure S7.** TA dynamics of the singlet exciton absorption peak for (a) PBDTTTPD:PCBM film and (b) PBDTTTPD:P(NDI2HD-T) film under one sunlight illumination for different times.

**Table S2.** Polaron formation kinetics for PBDTTTPD:P(NDI2HD-T) for varying solar illumination time. Note that parameter error is shown for time constants in parenthesis.

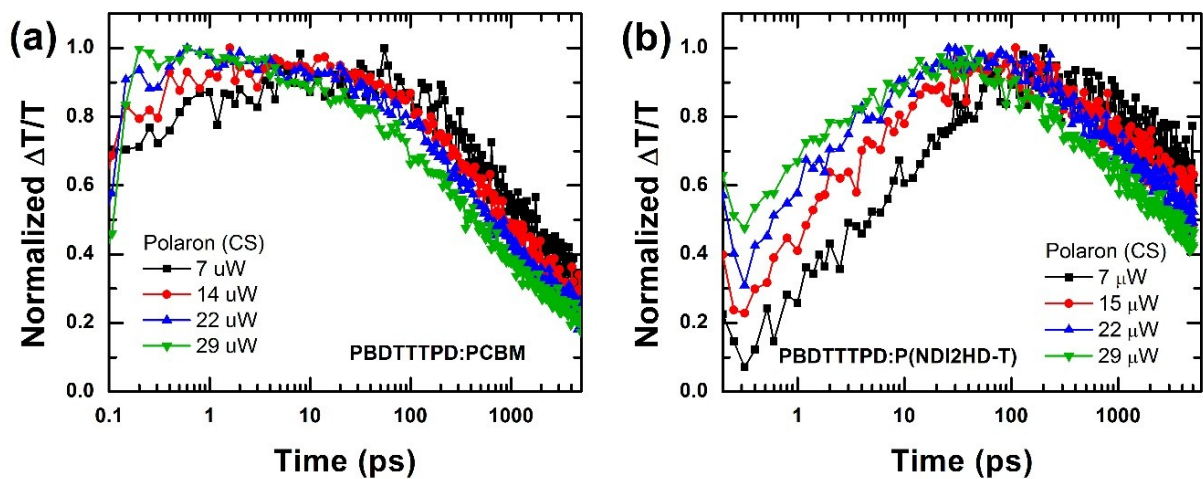

Illumination Time (h)	$A_1$	$\tau_1$	$A_2$	$\tau_2$
0	44%	0.87 (0.2) ps	56%	18 (3) ps
6	44%	0.44 (0.1) ps	56%	14 (2) ps
12	45%	0.43 (0.1) ps	55%	13 (2) ps
24	36%	0.79 (0.3) ps	64%	11 (3) ps

**Table S3.** Fit parameters for CS dynamics for PBDTTTPD:PCBM and PBDTTTPD:P(NDI2HD-T) films with different illumination times.

<b>Fit Parameter</b>	<b>System</b>	<b>0 h</b>	<b>6 h</b>	<b>12 h</b>	<b>24 h</b>
<b>A (%)</b>	PCBM-PSC	$64 \pm 2$	$56 \pm 2$	$56 \pm 3$	$52 \pm 2$
	All-PSC	$34 \pm 2$	$34 \pm 2$	$33 \pm 2$	$29 \pm 4$
<b><math>\tau</math> (ns)</b>	PCBM-PSC	$1.1 \pm 0.1$	$1.7 \pm 0.2$	$1.8 \pm 0.2$	$1.2 \pm 0.1$
	All-PSC	$2.0 \pm 0.4$	$1.5 \pm 0.3$	$1.5 \pm 0.3$	$2.4 \pm 0.9$
<b>B (%)</b>	PCBM-PSC	$36 \pm 2$	$44 \pm 2$	$44 \pm 3$	$48 \pm 2$
	All-PSC	$66 \pm 2$	$66 \pm 2$	$67 \pm 2$	$71 \pm 4$

**Figure S8.** Fluence dependent dynamics of the SE peak before irradiation of the (a) PBDTTTPD:PCBM blended film and (b) PBDTTTPD:P(NDI2HD-T) blended film.

**Figure S9.** Fluence dependent dynamics of the CS peak before irradiation of the (a) PBDTTTPD:PCBM blended film and (b) PBDTTTPD:P(NDI2HD-T) blended film.

**Table S4.** Hole mobility ( $\mu_h$ ) and electron mobility ( $\mu_e$ ) values of the prisitine films with different illumination times.

<b>Mobility</b>	<b>Material</b>	<b>0 h</b>	<b>6 h</b>	<b>12 h</b>	<b>24 h</b>
$\mu_h$ ( $\text{cm}^2/\text{V s}$ )	PBDTTTPD only	$3.33 \times 10^{-5}$	$1.22 \times 10^{-5}$	$2.66 \times 10^{-5}$	$1.02 \times 10^{-5}$
$\mu_e$ ( $\text{cm}^2/\text{V s}$ )	PCBM Only	$7.52 \times 10^{-4}$	$5.35 \times 10^{-5}$	$5.32 \times 10^{-5}$	$5.14 \times 10^{-5}$
	P(NDI2HD-T) only	$7.47 \times 10^{-5}$	$8.34 \times 10^{-5}$	$7.85 \times 10^{-5}$	$7.48 \times 10^{-5}$

**Figure S10.** UV-vis absorption spectra of (a) PBDTTTPD:PCBM, (b) PBDTTTPD:P(NDI2HD-T) and pristine PCBM films (inset of a) before and after (24 h) illumination.
