

Supplementary Information

Hollow POM@MOF Hybrids-Derived Porous Co₃O₄/CoMoO₄ Nanocages for Enhanced Electrocatalytic Water Oxidation

Linjie Zhang, Taoqing Mi, Muhammad Asad Ziae, Linfeng Liang, Ruihu Wang *

Supplementary Experimental Details

Tafel Slope Calculation of the Catalysts: The Tafel slope of the catalyst is calculated based on the Tafel equation:

$$\eta = a + b \times \log j$$

where η is overpotential in V, a is the Tafel constant in V, b is the Tafel slope in V dec⁻¹ and j is the current density in A cm⁻². The Tafel plot was drawn by plotting overpotential as a function of the current density in logarithm, and the slope of the linear region is the Tafel slope.

Electrochemically Active Surface Area (ECSA) Calculation of the Catalyst: The ECSA of the catalyst is calculated from the double-layer capacitance according to the following equation:

$$\text{ECSA} = R_f \times S$$

$$R_f = C_{dl} / C_s$$

where S is the geometric area of the smooth surface of the glassy carbon (GC) electrode (in this work, $S = 0.196$ cm²) and R_f is the roughness factor calculated from the ratio of double-layer capacitance (C_{dl}) for the working electrode and the corresponding smooth GC electrode, C_{dl} is the slope of plots for the anodic or cathodic current density against scan rates in the non-Faradaic region, C_s is measured by a similar method only without modifying the catalyst. Therefore, the comparison of ECSA can be replaced by the comparison of C_{dl} value.

Turnover Frequency (TOF) Calculation of the Catalyst: The TOF value is calculated from the equation:

$$\text{TOF} = J \times A / (4 \times F \times n)$$

where J is the current density at a specific overpotential in A cm^{-2} ; A is the area of the GCE; F is the Faraday constant with a value of 96485 C mol^{-1} ; and n is the number of moles of the active metal sites of the catalyst drop-cast on the electrode.

Faradaic Efficiency (ε) Calculation: The ε value is calculated from the equation:

$$\varepsilon = I_{\text{ring}} / (I_{\text{disk}} \times N)$$

where I_{disk} denotes the disk current, I_{ring} stands for the ring current, and N represents the current collection efficiency of the RRDE that is about 0.37 (Φ_{disk} and Φ_{ring} are 0.2475 and 0.1866 cm^2 , respectively. And the interval between glass carbon disk and Pt ring electrodes is $318 \mu\text{m}$).

Supplementary Figures

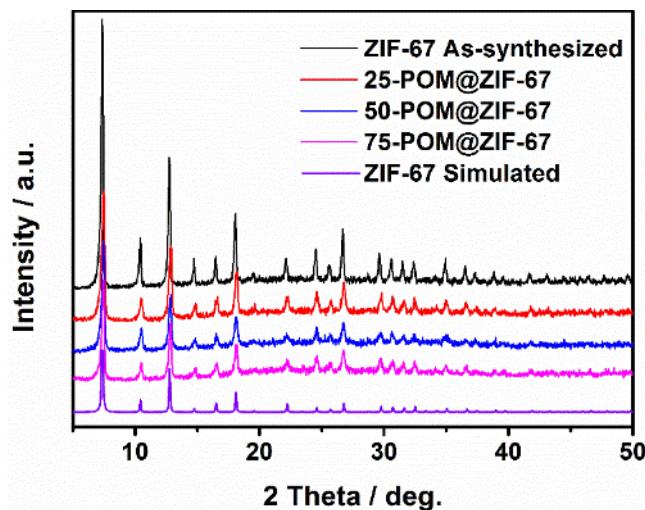

Fig. S1. PXRD patterns of as-synthesized ZIF-67 and POM@ZIF-67 hybrids.

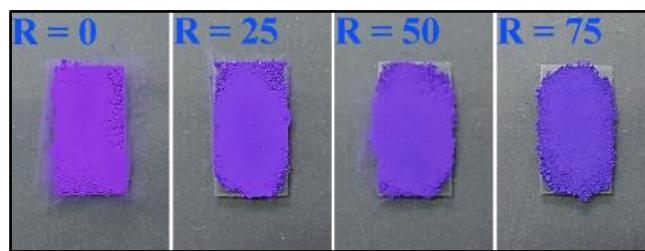

Fig. S2. Color change of POM@ZIF-67 hybrids with the increment of POM feeding amounts.

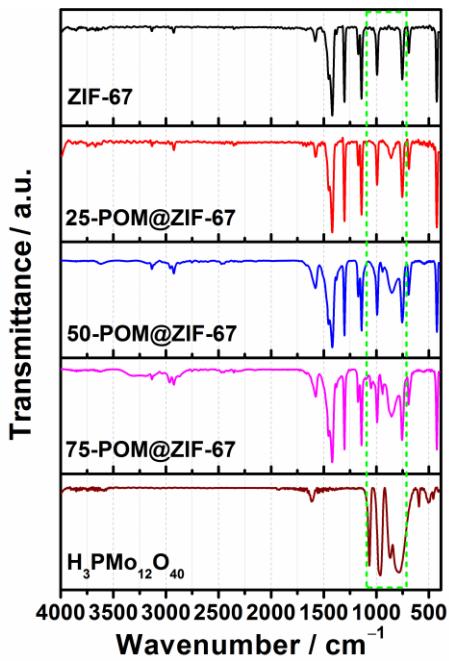

Fig. S3. FTIR spectra of $\text{H}_3\text{PMo}_{12}\text{O}_{40}$, ZIF-67 and POM@ZIF-67 hybrids. As shown in the green dash box, compared to the FTIR spectra of pure ZIF-67 and $\text{H}_3\text{PMo}_{12}\text{O}_{40}$, the intensity of peak at 868 cm^{-1} (Mo–O–Mo) in POM@ZIF-67 hybrid is gradually intensified with increment of POM loadings, and both the peaks at 961 cm^{-1} (Mo=O) and 1066 cm^{-1} (PO_4) become evident in 75-POM@ZIF-67.

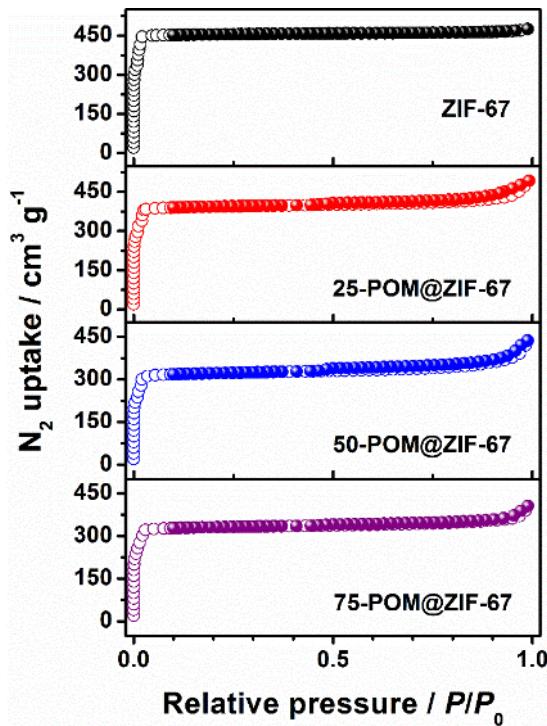

Fig. S4. N_2 sorption isotherms at 77 K for ZIF-67 and POM@ZIF-67 hybrids.

According to elemental analysis and ICP data (**Table S1**), the composition of POM@ZIF-67 with different POM loadings can be expressed as $\text{H}_3\text{PMo}_{12}\text{O}_{40} \subset [\text{Co}(\text{C}_4\text{H}_5\text{N}_2)_2]_{140}$, $\text{H}_3\text{PMo}_{12}\text{O}_{40} \subset [\text{Co}(\text{C}_4\text{H}_5\text{N}_2)_2]_{66}$ and $\text{H}_3\text{PMo}_{12}\text{O}_{40} \subset [\text{Co}(\text{C}_4\text{H}_5\text{N}_2)_2]_{47}$ for $R = 25, 50$ and 75 , respectively. Considering each SOD cage of ZIF-67 consists of 6 cobalt ions, there are *ca.* 23 (140/6), 11 (66/6) and 8 (47/6) SOD cages in 25-POM@ZIF-67, 50-POM@ZIF-67 and 75-POM@ZIF-67, respectively. Thus, POM guests occupy one out of every 23, 11 and 8 SOD cages in 25-POM@ZIF-67, 50-POM@ZIF-67 and 75-POM@ZIF-67, respectively, leaving 22, 10 and 7 SOD cages accessible for N_2 adsorbate. We could assume the volume factors are 0.9565 (22/23), 0.9091 (10/11) and 0.875 (7/8), respectively. Accordingly the mass factors of ZIF-67 (excluding the mass contribution of POMs) in 25-POM@ZIF-67, 50-POM@ZIF-67 and 75-POM@ZIF-67 are 0.9443, 0.8896 and 0.8508, respectively. The multiplication values of their mass factors and volume factors are 0.9032, 0.8087 and 0.7445, respectively, and when multiply these values by the BET surface area of pristine ZIF-67 ($1833 \text{ m}^2 \text{ g}^{-1}$), we can get 1655, 1482 and $1365 \text{ m}^2 \text{ g}^{-1}$ as the theoretical BET surface areas. They are very close to the experimental BET surface areas of 1642, 1465, and $1323 \text{ m}^2 \text{ g}^{-1}$, respectively. However, when we simply assume that POMs only contribute to the total mass of each sample without occupying any cages, their calculated surface areas turn to be 1731, 1631 and $1560 \text{ m}^2 \text{ g}^{-1}$, respectively, which are far from the experimental data. Therefore, it is reasonable to infer that all POMs are encapsulated into the cavities of ZIF-67 in POM@ZIF-67 hybrids.

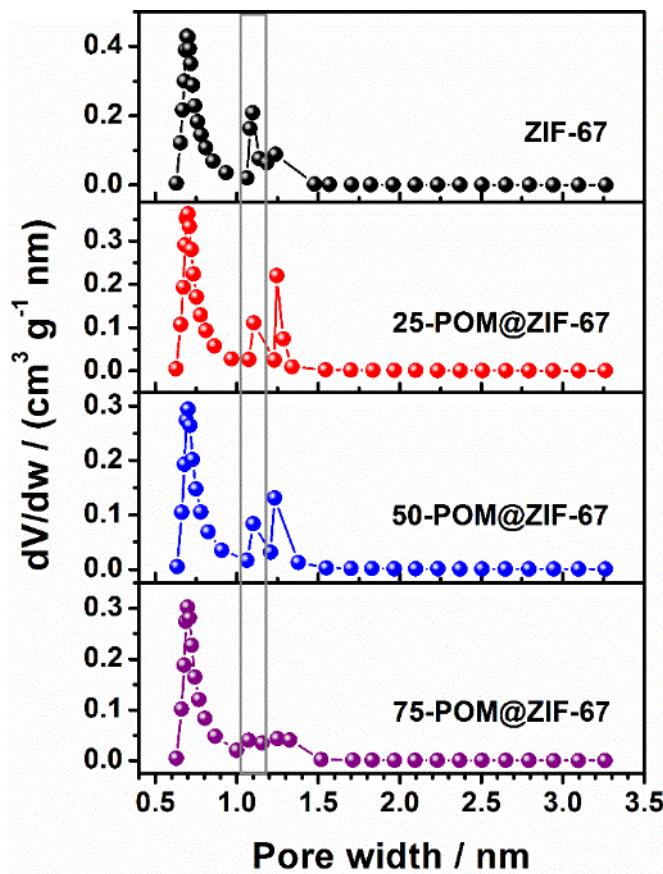

Fig. S5. PSD curves of ZIF-67 and POM@ZIF-67 hybrids calculated by using Horvath-Kawazoe model.

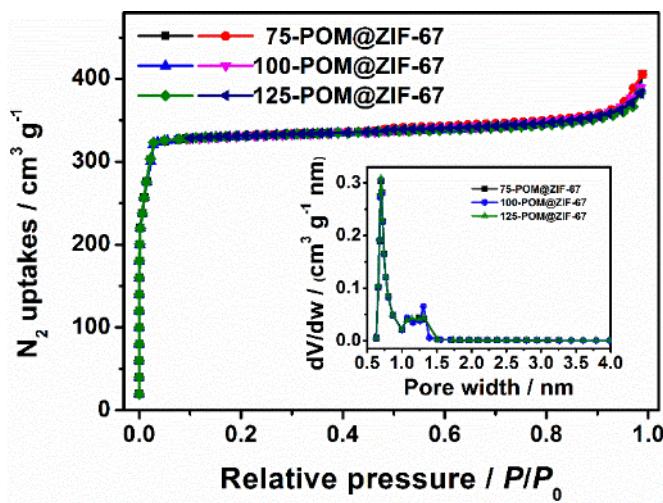

Fig. S6. N₂ sorption isotherms (77 K) and PSD curves of 75-POM@ZIF-67, 100-POM@ZIF-67 and 125-POM@ZIF-67. The PSD are calculated by using Horvath-Kawazoe model.

All data acquisition and processing were performed using the Thermo Avantage data system, version 5.932. For Co₃O₄ and each Co₃O₄/CoMoO₄ composite, the data listed in the first and second lines are corresponding peak binding energy (eV) and area (CPS.eV), respectively. According to the independent total peak areas of Co²⁺ pairs and Co³⁺ pairs, the surface Co²⁺/Co³⁺ ratio can be calculated as follows:

Co₃O₄:

$$(22373.11 + 10257.87 + 5270.20 + 1966.36) / (47936.54 + 17261.30 + 21121.25 + 8245.45 + 6403.48 + 6177.86) \\ = 39867.54 / 107145.88 = 0.37$$

Co₃O₄/CoMoO₄-25:

$$(22110.71 + 15344.20 + 7030.97 + 3882.42) / (43626.14 + 6199.20 + 11815.91 + 8208.56 + 4374.22 + 5050.15) \\ = 48368.3 / 79274.18 = 0.61$$

Co₃O₄/CoMoO₄-50:

$$(23550.44 + 7893.79 + 3500.12 + 3533.16) / (18612.30 + 6044.61 + 7736.04 + 4586.63 + 3183.27 + 3502.79) \\ = 38477.51 / 43665.64 = 0.88$$

Co₃O₄/CoMoO₄-75:

$$(32825.85 + 8534.72 + 5252.14 + 3610.84) / (13786.86 + 4595.62 + 10176.01 + 8206.46 + 3282.58 + 2954.33) \\ = 50223.55 / 43001.86 = 1.16$$
