Table S1 Changes in weight, size and volume from CFs to PFs.

	polarity	n <sub>D</sub>	viscosity
H <sub>2</sub> O	10.2	1.3330	1
MeOH	6.6	1.3284	0.6
EtOH	4.3	1.3614	1.2
ProOH	4	1.3862	2.27

**Table S2.** The polarity, refractive index  $(n_D)$  and viscosity of MeOH, EtOH, ProOH as well as H<sub>2</sub>O.

## Notion:

Besides the influence of the solvent polarity as discussed in the maintext, we have also simply analyzed the possible influence caused by the change of  $n_D$ . As the films are dried under the same condition, solvent with a higher viscosity has more chance to be trapped inside the film, which will induce a change of  $n_D$ . This effect is enhanced considering that solvent with a higher viscosity also exhibits a higher  $n_D$ , as seen from the table above.

Although such analysis is qualitatively correct for the series of films prepared from MeOH, EtOH and ProOH, difficulties were encountered when generalized to the film prepared from H<sub>2</sub>O. Thus we conclude that, the influence of the change of  $n_D$ , if it does exist, should be minor.
