## 1 EXPERIMENTAL SECTION

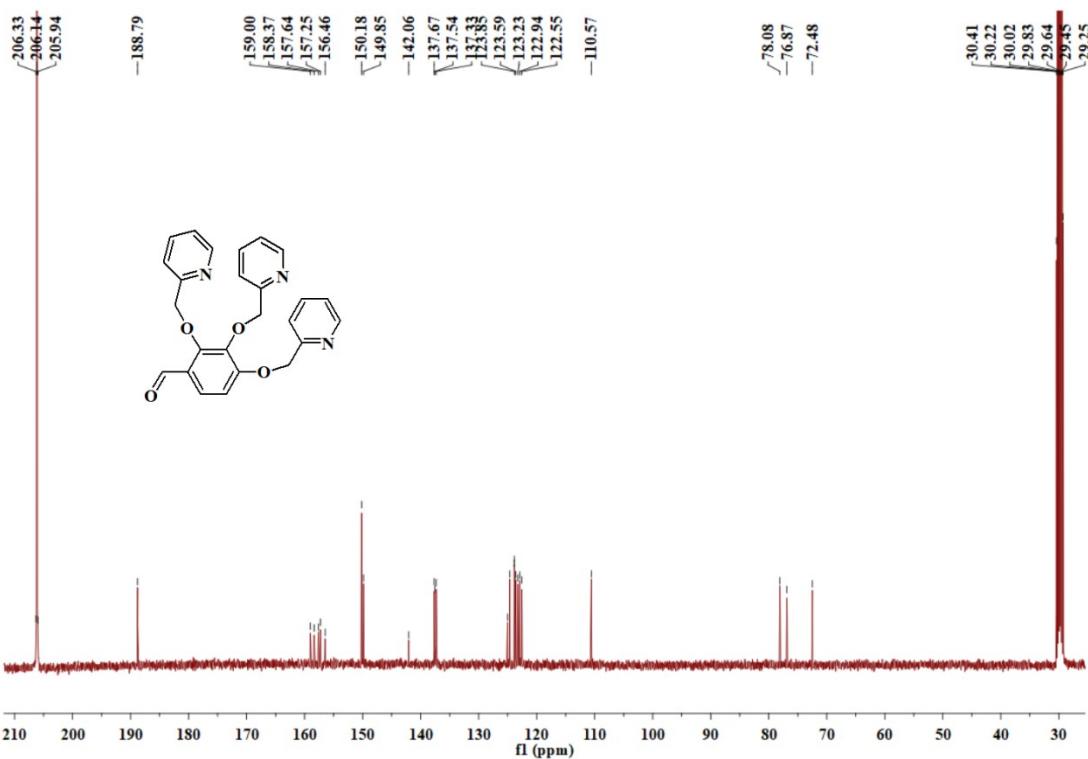

## 2 Materials and instruments

3 All chemical reagents and solvents, unless otherwise noted, were purchased from  
 4 commercial suppliers and used as received without further purification. Aqueous  
 5 solutions ( $1.0 \times 10^{-2}$  M) of  $\text{Hg}^{2+}$  was prepared from its bromate salt, and the other metal  
 6 ions were prepared from their nitrate salts, an aqueous solution of **TPI** ( $1.0 \times 10^{-5}$  M)  
 7 was prepared(1% DMSO served as co-solvent), respectively.  $^1\text{H}$  NMR spectra (400  
 8 MHz, 600 MHz) and  $^{13}\text{C}$  NMR spectra (100 MHz)were recorded on Bruker Avance  
 9 with deuterated acetone, DMSO, chloroform or methyl alcohol solvent, and  
 10 tetramethylsilane (TMS) as the internal standard, respectively. All coupling constants  
 11 ( $J$ ) are given in Hz,  $\delta$  values are reported in parts per million. Mass spectra were  
 12 obtained on a Thermo Fisher Scientific LTO-Orbitrap mass spectrometer. IR spectra  
 13 were collected on Nicolet FT-IR NEXUS 870 spectrometer by KBr pellet method, in  
 14 the region of  $4000\text{-}400\text{ cm}^{-1}$ . Ultraviolet-visible (UV-vis) spectra were taken on a UV-  
 15 265 spectrophotometer. Fluorescence spectra were recorded on a Hitachi F-7000  
 16 fluorescence spectrophotometer.
