1. General considerations

NMR Equipment. NMR measurements were made using a Bruker 400 MHz Avance III spectrometer equipped with either a TXO flow probe linked directly to the Polarizer[1] (for flow experiments) or BBI probe (for shake measurements). All measurements were made at 298 K.

Parahydrogen was prepared by flowing hydrogen gas over either charcoal at 30 K in a house-built apparatus (used in shake measurements) or iron oxide catalyst at 36 K (used in flow experiments).

Shake and drop' experiments: This method utilises a parahydrogen ($p\text{-H}_2$) source to fill the NMR tube which are then shaken in a specific stray magnetic field of the magnet. These areas were $\sim 2\text{G}$, and $\sim 65\text{G}$. It should be noted these are approximate values obtained from a gauss meter. All experiments were performed on the same 400 MHz NMR spectrometer unless stated otherwise. After each 'shake and drop' the sample is ejected, emptied of H_2 by vacuum and refilled with a fresh batch of $p\text{-H}_2$ (at 3 bar pressure). In temperature studies, the sample is left at a certain temperature (i.e. in ice or a heated water bath) for 3 minutes before shaking and inserting into the spectrometer. To a Young's capped NMR tube was added the SABRE catalyst ($\sim 2\text{ mg}$), the solvent and quinoxaline.

2. Synthesis of 3,4-dihydroquinazoline

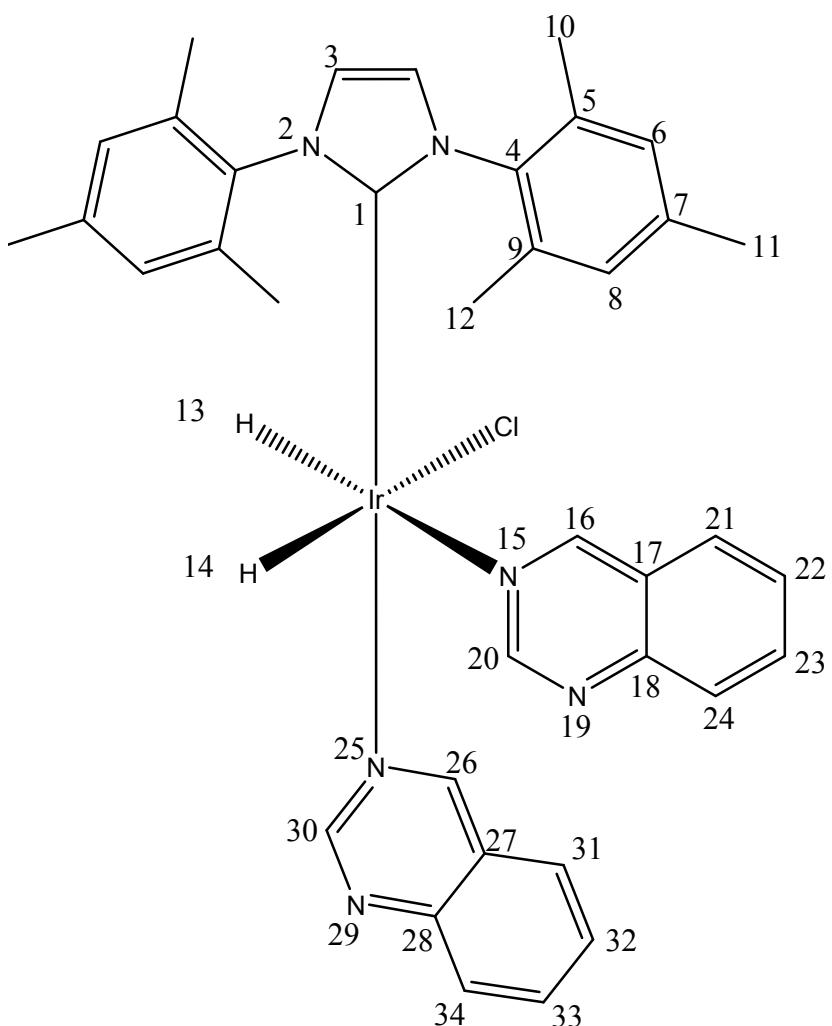

o-Aminobenzylamine (4.0 g, 33 mmol) was dissolved in anhydrous triethylorthoformate (20 ml, 120 mmol). The reaction was refluxed at 120°C for 14 hr and allowed to cool to room temperature. The reaction mixture was concentrated under reduced pressure to give a beige solid. The crude product was obtained and recrystallized from toluene to give a cream coloured solid (2.8 g, 21 mmol, 64.7 %). This was then stored in a glovebox.

Melting Point 123-126.5 (lit. 125-126)

Table S1: NMR data 3,4-dihydroquinazoline

Atom label	¹ H resonance	¹³ C resonance	¹⁵ N resonance

9		120.6	
10		139.9	

3. NMR Characterisation data for **2** collected in DCM

The formation of **2** was confirmed by a series of 1D NOE measurements that mapped interactions between the hydride ligands and the protons of the bound Qu ligands. Complete ligand assignment was achieved using COSY methods with heteronuclear multiple quantum correlation (HMQC) spectra being used to locate the corresponding ^{15}N signals associated with the bound Qu ligands. These spectra yielded ^{15}N chemical shift values for the N_1 site of free Qu at δ 281.3, where $J_{\text{NH}} = 14.9$ Hz, and the N_3 site at δ 291.8, with *ortho* J_{NH} values of 10.8 and 15 Hz (see Scheme 1 for site numbering). Five further ^{15}N resonances were located at δ 192.9, 226.2, 246.5, 282.9 and 283.6 in this spectrum. Of these, the signal at δ 192.9 arises from the IMes ligand's nitrogen centre while the bound $\text{N}_{3\text{e}}$ -Qu site provides the signal at δ 246.5 which couples strongly (14 Hz) to hydride H_a . Thus their mutual *trans* orientation is confirmed. The $\text{N}_{1\text{e}}$ signal of this ligand appears at δ 283.6 and connects to a δ 9.40 aromatic resonance through a J_{NH} coupling of 16 Hz. Hence upon binding to iridium, the ^{15}N shift of the Qu- $\text{N}_{3\text{e}}$ moves to lower field by 45.3 ppm while that of the unbound N_1 site moves to higher field by 2.3 ppm. These shifts are of the same order as those observed for pyridine in the related complex *trans*-(H_N)(H,Cl)-[Ir(Py^{15}N)($\text{P}(\text{C}_6\text{H}_5)_3$)₂.⁴⁶ The Ir- $\text{N}_{3\text{a}}$ and $\text{N}_{1\text{a}}$ resonances of the axial Qu ligand

of **2** appear at δ 226.2 and 282.9 respectively, with the N_{3a} binding shift of 65.6 ppm suggesting a stronger bonding interaction in the axial Qu ligand. Confirmation of the presence of the directly bound, but NMR silent, chloride ligand was obtained by the addition of AgBF₄ which resulted in conversion of **2** into the initially predicted *tris*-substituted cation [Ir(H)₂(IMes)(Qu)₃]BF₄.

6. Effect of time on inorganic product speciation

This change is reflected in the hydride region of the corresponding ^1H NMR spectra. After catalyst activation, just one hydride signal results due to **4** when the substrate is completely converted. As the complex is vastly outnumbered by the substrate, the hydride intensities are often very weak and only clearly visible through hyperpolarisation. As the reaction proceeds the hydride region becomes complicated as 3,4-dihydroquinazoline competes with quinazoline for binding until eventually **5** dominates (Fig S1).

Figure S1. Series of four hyperpolarised ^1H NMR spectra showing the conversion of **4** (upper) into **5** (lower) with reaction time.

7. Hydride ligand interconversion rate and rate of exchange into free hydrogen as determined via EXSY data for 2

Analysis of these data yield rate constants for hydride site interchange and H₂ loss as detailed in Table S13.

Table S13. Hydride Ligand exchange are H₂ loss rates for **2**

Temperature	Rate (s ⁻¹), H ₂ loss	Hydride Site Interchange
263	0.14	0.00
268	0.50	0.38
273	0.59	0.60
278	0.90	1.34
283	1.55	3.09

288	2.93	6.53
293	6.64	9.97
298	13.96	26.98

Figure S2: Typical kinetic trace associated with the EXSY data used to determine rate constants for H₂ loss and H_a-H_b site interchange in **2**.

8. DFT calculations

All DFT calculations were performed on the full molecule (without simplification) using the Gaussian 09 software package.^[2] Solvent effects were modelled using the integral equation formalism variant (IEFPCM) of the Polarizable Continuum Model (PCM)^[3-5] with the solvent specified as methanol or dichloromethane as appropriate. Structures were optimised using the PBE0 functional of Adamo *et al.*^[6] This hybrid functional has been shown to perform well for transition metals^[7, 8] and a recent review of DFT by Tsipis recommends its use.^[9] The def2-SVP basis set of Ahlrichs^[10-13] was used for all atoms, except the hydride ligand atoms for which the def2-TZVPP basis set^[10] was used, and iridium to which the LANL08(f) basis set was assigned together with the associated effective core potential (ECP).^[14] Frequency calculations were used to identify local minima as well as first-order saddle points (transition states) and also provided zero-point energies and thermal corrections to the energy at 298.15 K. Thermodynamic parameters were determined from single point energy calculations performed on the optimised structures using the def2-TZVPP^[10-13, 15] basis sets for all atoms, along with the GD3BJ empirical dispersion correction from Grimme which includes Beck-

Johnson damping^[16]. The thermal energy corrections were then applied to obtain chemical enthalpies and free energies.

The effects of Basis Set Superposition Error (BSSE) were assessed by conducting counterpoise calculations^[17, 18] on **2**. These calculations suggest that the magnitude of the errors arising for the Ir-N bond is small and so could reasonably be neglected ($\sim 4 \text{ kJ mol}^{-1}$) whereas the Ir-Cl bond has a larger error at 27 kJ mol^{-1} and so was included in the stability calculations.

The Free Energy profile for the catalytic cycle shown in Scheme 2 is shown below in Figure S3

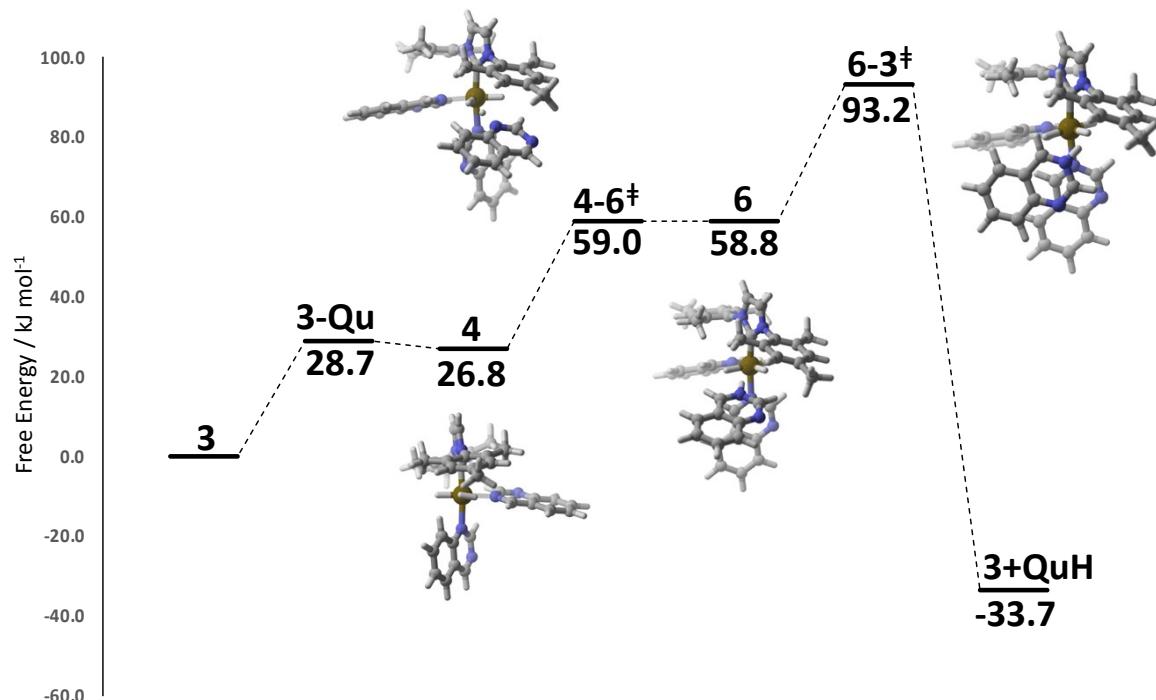

Figure S3: Catalytic cycle free energy profile for the hydrogenation of quinazoline into 3,4-dihydroquinazoline

It should be noted that free energy change for the loss of quinazoline is over-estimated by the calculations, arising from the creation of two species from one (**3**). The stabilisation of complex **4** from the coordination of dihydrogen is also underestimated for the same reason. The loss of protonated quinazoline from complex **6** is unfavourable, with the transition state **6-3[‡]** lying on the lower energy pathway.

Table S14: Energy and Cartesian coordinates for **2** with DCM solvation

9. X Ray Data for sbd1415

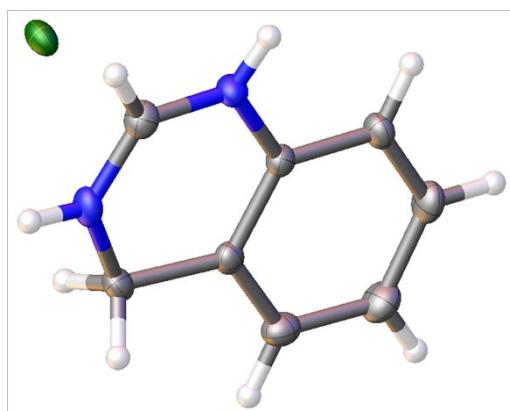

Table S23 Crystal data and structure refinement for sbd1415.

Identification code	sbd1415
Empirical formula	C ₈ H ₉ ClN ₂
Formula weight	168.62
Temperature/K	110.00(14)
Crystal system	triclinic
Space group	P-1
a/Å	5.5421(5)
b/Å	7.9319(9)
c/Å	9.4933(3)
α/°	82.068(6)
β/°	76.113(6)
γ/°	80.977(8)
Volume/Å ³	397.91(6)
Z	2
ρ _{calc} g/cm ³	1.407
μ/mm ⁻¹	0.410
F(000)	176.0
Crystal size/mm ³	0.2714 × 0.0838 × 0.0192
Radiation	MoKα ($\lambda = 0.71073$)
2θ range for data collection/°	7.21 to 64.056
Index ranges	-7 ≤ h ≤ 7, -11 ≤ k ≤ 10, -13 ≤ l ≤ 13
Reflections collected	4030

Independent reflections	2425 [$R_{\text{int}} = 0.0273$, $R_{\text{sigma}} = 0.0494$]
Data/restraints/parameters	2425/0/108
Goodness-of-fit on F^2	1.129
Final R indexes [$ I \geq 2\sigma(I)$]	$R_1 = 0.0562$, $wR_2 = 0.1316$
Final R indexes [all data]	$R_1 = 0.0648$, $wR_2 = 0.1363$
Largest diff. peak/hole / e Å ⁻³	0.66/-0.32
Structure	solved
	by Natalie Pridmore

Table S24 Fractional Atomic Coordinates ($\times 10^4$) and Equivalent Isotropic Displacement Parameters (Å² $\times 10^3$) for sbd1415. U_{eq} is defined as 1/3 of the trace of the orthogonalised U_{ij} tensor.

Atom	x	y	z	U(eq)
Cl1	8860.7 (11)	2268.0 (7)	3789.8 (6)	20.08 (15)

H8A	6534	-209	6631	26
H8B	4434	-440	8059	26
H1A	2960 (60)	4970 (40)	6330 (30)	21 (7)
H2	2480 (70)	360 (50)	6160 (40)	43 (10)

Experimental

Single crystals of $\text{C}_8\text{H}_9\text{ClN}_2$ [**sbd1415**] were obtained. A suitable crystal was selected and **analyzed** on a **SuperNova, Dual, Cu at zero, Eos** diffractometer. The crystal was kept at 110.00(14) K during data collection. Using Olex2 [19], the structure was solved with the Superflip [20] structure solution program using Charge Flipping and refined with the ShelXL [21] refinement package using Least Squares minimization.

Crystal structure determination of **[sbd1415]** Crystal Data for $\text{C}_8\text{H}_9\text{ClN}_2$ ($M=168.62$ g/mol): triclinic, space group P-1 (no. 2), $a = 5.5421(5)$ \AA , $b = 7.9319(9)$ \AA , $c = 9.4933(3)$ \AA , $\alpha = 82.068(6)^\circ$, $\beta = 76.113(6)^\circ$, $\gamma = 80.977(8)^\circ$, $V = 397.91(6)$ \AA^3 , $Z = 2$, $T = 110.00(14)$ K, $\mu(\text{MoK}\alpha) = 0.410$ mm^{-1} , $D_{\text{calc}} = 1.407$ g/cm³, 4030 reflections measured ($7.21^\circ \leq 2\Theta \leq 64.056^\circ$), 2425 unique ($R_{\text{int}} = 0.0273$, $R_{\text{sigma}} = 0.0494$) which were used in all calculations. The final R_1 was 0.0562 ($I > 2\sigma(I)$) and wR_2 was 0.1363 (all data).

Refinement model description

Number of restraints - 0, number of constraints - unknown.

Details:

1. Fixed Uiso
At 1.2 times of:
All C(H) groups, All C(H,H) groups
- 2.a Secondary CH₂ refined with riding coordinates:
C8(H8A,H8B)
- 2.b Aromatic/amide H refined with riding coordinates:
C1(H1), C3(H3), C4(H4), C5(H5), C6(H6)

This report has been created with Olex2, compiled on 2014.09.19 svn.r3010 for OlexSys.
