1. General procedures.

Moisture and air-sensitive materials were performed under a purified argon atmosphere using standard Schlenk techniques. The solvents were freshly distilled from sodium benzophenone ketyl under argon prior to use.

$\text{Ln}[\text{N}(\text{SiMe}_3)_2]_3(\mu\text{-Cl})\text{Li}(\text{THF})_3$ ($\text{Ln} = \text{Y}, \text{Yb}$) were prepared by using a literature procedures.¹ Salan ligands { $\text{H}_2\text{L} = [\text{CH}_2\text{N}(\text{R})\text{CH}_2(\text{C}_6\text{H}_2\text{-2-OH-3,5-'Bu}_2)]_2$; $\text{H}_2\text{L}^1, \text{R} = \text{Ph}$; $\text{H}_2\text{L}^2, \text{R} = \text{Cy}$; $\text{H}_2\text{L}^3, \text{R} = \text{'Bu}$ } were synthesized according to the similar procedures reported in the literature.² *rac*- β -Butyrolactone (*rac*-BBL) was freshly distilled from CaH_2 under argon and degassed thoroughly by freeze-pump-thaw cycles prior to use. Carbon, hydrogen, and nitrogen analyses were performed by direct combustion with a Carlo-Erba EA-1110 instrument. ^1H and ^{13}C NMR spectra were recorded with Bruker AV-400 NMR and Bruker AV-600 NMR spectrometer. Molecular weight and molecular weight distribution (PDI) of PHBs were determined by gel permeation chromatography (GPC) on a HLC 8320 apparatus at 40 °C, using THF as solvent, a flow rate of eluent of 0.35 mL/min. X-ray crystallographic data were collected using an Agilent Gemini Atlas or a Bruker D8 QUEST CCD X-ray diffractometer. The diffracted intensities were corrected for Lorentz/polarization effects and empirical absorption corrections. The structures were solved by direct methods and refined by full-matrix least-squares procedures based on $|F|^2$. All of the non-hydrogen atoms were refined anisotropically. The hydrogen atoms were all generated geometrically, assigned appropriate isotropic thermal parameters, and allowed to ride on their parent carbon atoms. All of the hydrogen atoms were held

stationary and included in the structure factor calculation in the final stage of full matrix least-squares refinement. The structures were solved and refined using SHELXL programs.
