# Narrow-Band Blue Emitting Nitridomagnesosilicate Phosphor $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$ : $\mathrm{Eu}^{2+}$ for phosphor-converted LEDs 

Chao Li, ${ }^{\text {a }}$ Hong-Wei Zheng, ${ }^{a}$ Heng-Wei Wei, ${ }^{\text {a }}$ Jie Su, ${ }^{\text {b }}$ Fu-Hui Liao, ${ }^{\text {b }}$ Zhen-Yi Zhang, ${ }^{\text {c }}$ Ling Xu, ${ }^{\text {a }}{ }^{\text {Zu-Pei }}$ Yang, ${ }^{\text {ad }}$ Xiao-Ming Wang, ${ }^{* a}$ and Huan Jiao*a

## Electronic Supplementary Information (ESI):

## Experimental Section.

Sample Preparation. The compound $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$ was prepared by solid state reactions in a horizontal tube furnace using the starting materials $\mathrm{Sr}_{3} \mathrm{~N}_{2}$ (AR), amorphous $\mathrm{Si}_{3} \mathrm{~N}_{4}$ (Alfa 95\%), Mg powder (AR). EuF 2 (Alfa 99.5\%). The raw materials were mixed in an agate mortar and filled into a tungsten crucible under argon atmosphere in a glovebox (Mikrouna, $\mathrm{O}_{2}<1 \mathrm{ppm}$, $\mathrm{H}_{2} \mathrm{O}<1 \mathrm{ppm}$ ). The tungsten crucible was placed in an alumina tube furnace and heated to $1400{ }^{\circ} \mathrm{C}$ with a rate of $300^{\circ} \mathrm{C} / \mathrm{h}$ and maintained at that temperature for 5 h , and then followed by cooling down to $800{ }^{\circ} \mathrm{C}$ at a rate $1{ }^{\circ} \mathrm{C} / \mathrm{min}$. After reaction, the furnace down to room temperature spontaneously with power switch off and the tungsten crucible were opened in glovebox. All the heating and cooling processes are conducted in a reductive atmosphere of 6:94 (volume) $\mathrm{H}_{2} / \mathrm{N}_{2}$.

Single Crystal X-ray Diffraction. Single crystals were collected under a polarization microscope. The $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$ crystal data was collected using a Bruker D8 Quest diffractometer with PHOTON 100 CMOS detector and monochromatic Mo K $\alpha$ radiation ( $\lambda=$ 0.71073 Å). A multiscan absorption correction was applied to the intensity datasets. The crystal structures were solved by Direct Methods (SHELXS) and refined by full-matrix leastsquares methods (SHELXL).

High Resolution Powder X-ray Diffraction. In order to avoid hydrolysis, data were obtained using a PANalytical Empyrean diffractometer in capillary mode (Debye-Scherrer geometry using a $\mathrm{Cu} K \alpha$ radiation source ( $\lambda=1.5418 \AA$ Aㅇ) with a 0.5 mm borosilicate capillary sample holder at a spinning rate of $0.5 \mathrm{r} / \mathrm{s}$ to suppress the preferred orientation of the crystals) at 40 kV and 40 mA . The scan $2 \theta$ range was from $10^{\circ}$ to $120^{\circ}$ with a step size of $0.013^{\circ}$ and a total data collection time of 3 h . The Rietveld refinements on X-ray diffraction data were performed by using the software TOPAS 5.

Density Functional Theory (DFT) Calculation. The DFT calculation of $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$ was performed with the Cambridge Serial Total Energy Package (CASTEP) code, in which plane wave basis set was chosen for the expansion of valance-electron wave functions at the local density approximation (LDA) level. There are two steps of calculations to obtain the electronic band structure of $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$. The first step was to optimize its crystal structure beginning with the crystallographic data refined from the XRD data by the Broyden-Fletcher-Goldfarb-Shannon (BFGS) method. In order avoid calculation error, the cooccupied Si 2 and Mg 3 were separated by reducing the space group symmetry to P1 (No.1). The second step was to calculate the band structure and density of states (DOS). For the calculations, energy cutoff of plane wave basis set was selected as 340 eV , and $K$-point sampling was chosen as $4 \times 4 \times 2$ Monkhorst-Pack grid (separation $\sim 0.04 \AA^{-1}$ ). Criterion for
the self-consistent field (SCF) was eigenenergy convergence within $1.0 \times 10^{-7} \mathrm{eV} /$ atom. Pseudopotential of each atom was constructed from the CASTEP database.

Scanning Electron Microscopy. The particle morphology of $\mathrm{Sr}_{8} \mathrm{Mg}_{7} \mathrm{Si}_{9} \mathrm{~N}_{22}$ powder was observed by a scanning electron microscopy (SEM, FEI Q25) with an accelerating voltage of 20 kV . Chemical analysis were performed on energy dispersive X-ray spectroscopy (EDX) (EDAX, Element System) with an element silicon drift detector (SDD) and APEX ${ }^{\text {™ }}$ software.

Luminescence Properties. The diffuse reflection spectrum was collected by a UV-3100 UV-vis-NIR spectrometer (Shimadzu, Japan) using the white powder $\mathrm{BaSO}_{4}$ as a standard material. The photoluminescence emission and excitation spectra were measured at room temperature using a Hitachi F-4600 fluorescent spectrophotometer (Japan) with a 150 W Xe lamp as excitation source. The spectrum correction was applied and color coordinates were calculated by using the spectra data. High temperature PL spectra were investigated between $25{ }^{\circ} \mathrm{C}$ and $250{ }^{\circ} \mathrm{C}$ by using a TAP-02 high-temperature fluorescence analyzer. The luminescence decay curves were obtained by using a life time and steady state spectrometer (FLS920, Edinburgh Instruments Ltd). Absolute quantum efficiency was measured by the integrating sphere on the Edinburgh FLS 920 fluorescence spectrometer combined with a 450 W Xe lamp as the excitation source, and white $\mathrm{BaSO}_{4}$ is employed to be a reference.

Band Gap Calculation from UV/vis Spectroscopy. The band gap is estimated according to Equation (1).

$$
\begin{equation*}
(\alpha h v)^{\mathrm{n}}=\mathrm{A}\left(\mathrm{hv}-E_{\mathrm{g}}\right) \tag{1}
\end{equation*}
$$

The hv is incident photon energy; A is a constant; $\alpha$ is the absorption coefficient; $\mathrm{n}=2$ for a direct transition or $1 / 2$ for an indirect transition. The values of $(\alpha h v)^{1 / 2}$ are plotted as a function of the incident photon energy (hv) from the linear extrapolation of ( $\alpha \mathrm{hv})^{1 / 2}=0$.
