2. Isomerization from intermediate CP6 to intermediate CP8.

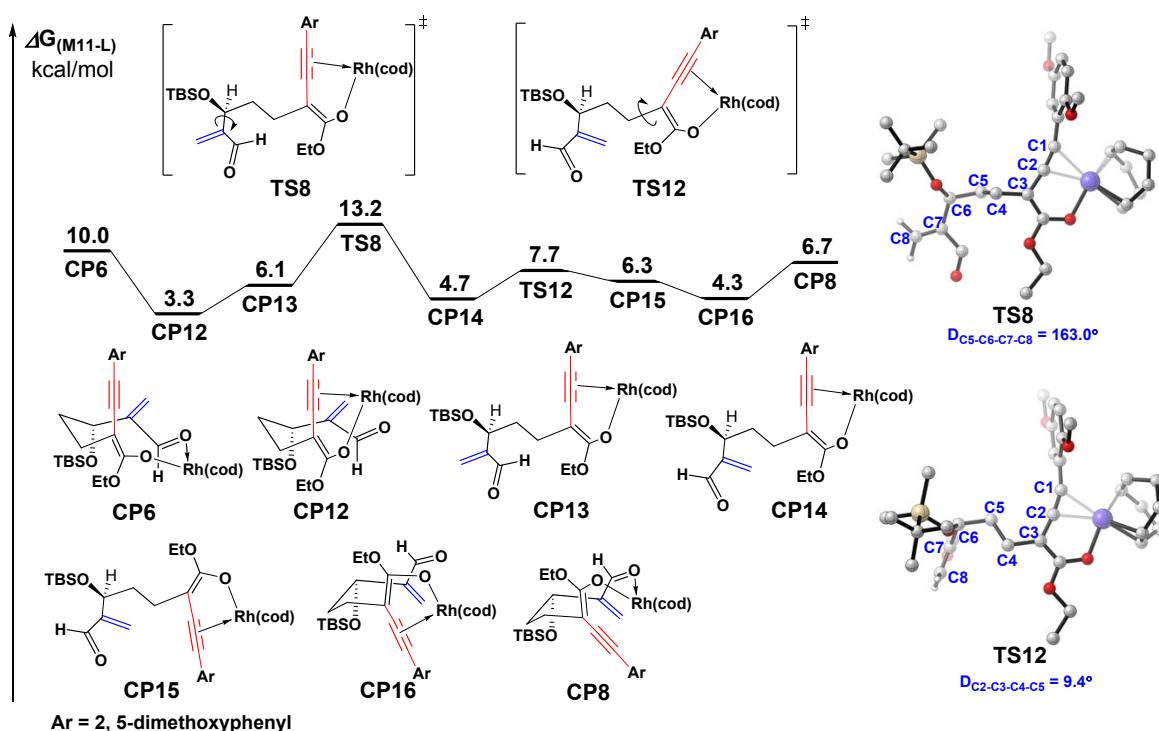

Figure S1. Gibbs free energy profiles for the isomerization from intermediate **CP6** to intermediate **CP8**. The bond lengths are given in angstrom.

The Gibbs free energy profiles for the isomerization from intermediate **CP6** to intermediate **CP8** are shown in Figure S1. As shown in Figure S1, the enolate-Rh intermediate **CP6** can isomerize to the open-ring intermediate **CP12** with 6.7 kcal/mol exothermic. With the ring opened, intermediate **CP12** can isomerize to **CP13** further (2.7 kcal/mol endothermic). The subsequent rotation of vinyl aldehyde in **CP13** can occur through transition state **TS8**, generates intermediate **CP14**. The activation free energy of this rotation is only 9.9 kcal/mol. The enolate-rhodium and acetylene in **CP14** can also rotate via transition state **TS12**, with a barrier of only 3.0 kcal/mol, to get intermediate **CP15**. Intermediate **CP15** can also isomerize to **CP16** with 1.5 kcal/mol exothermic. With closing the ring in **CP16**, the ten-membered-ring allenzo-rhodium intermediate **CP8** is generated. The calculated results indicated that the overall barrier for the isomerization from intermediate **CP6** to intermediate **CP8** is only 9.9 kcal/mol. Meanwhile, this isomerization is exergonic by 3.3 kcal/mol.

3. The coordination capabilities of terminal alkyne and aryl alkyne.

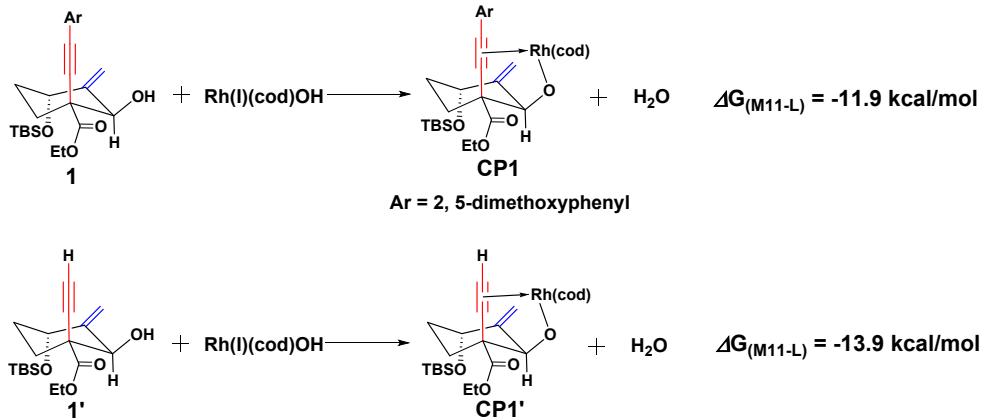

Figure S2. The reaction Gibbs energies of ligand exchange for Rh(I)LnOH with aryl alkyne **1** and terminal alkyne **1'**.

The reaction Gibbs energies of ligand exchange for Rh(I)LnOH with **1** and **1'** are shown in Figure S2. The reaction Gibbs energies of ligand exchange between Rh(I)LnOH and **1**, with aryl alkyne, is -11.9 kcal/mol. While the reaction Gibbs energies of ligand exchange between Rh(I)LnOH and **1'**, with terminal alkyne, is -13.9 kcal/mol. The calculated results indicated that the coordination capability of terminal alkyne in **1'** is stronger than aryl alkyne in **1**. The lower coordination capability of aryl alkyne in **1a** also makes contribution to conduct the retro-Aldol type reaction to cleave the C-C bond.

4. The intramolecular Michael-type addition of acetylene to enal moiety in allene-Rhodium intermediate **CP17**.

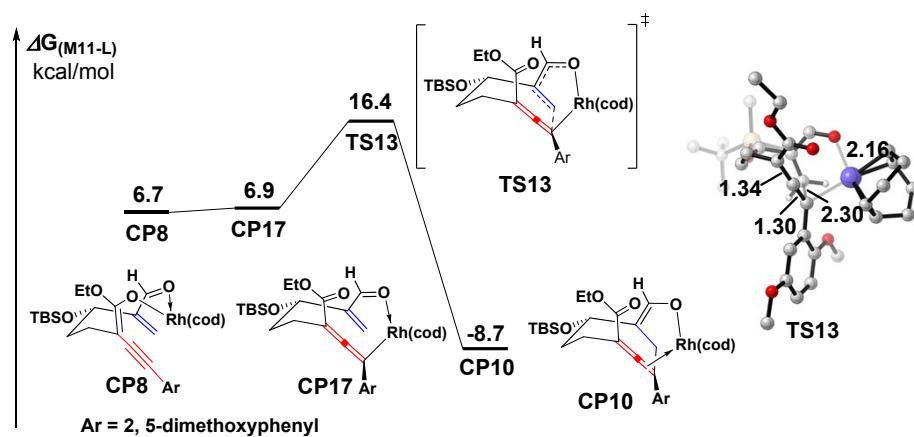

Figure S3. The Gibbs energies profile for intramolecular Michael-type addition of acetylene to enal moiety in allene-Rh intermediate **CP17**.

As shown in Figure S3, the intermediate **CP8** isomerize to allene-Rhodium intermediate **CP17** with 0.2 kcal/mol endothermic. The intramolecular Michael-type addition of acetylene to enal moiety in enolate-Rhodium intermediate **CP17** then occurs via transition state **TS13**. The activation energy of

TS13 is 4.7 kcal/mol higher than that of **TS9**, which indicates that this intramolecular Michael-type addition of allene-Rhodium intermediate **CP17** is unfavorable.

5. The pathway of the 3,3-sigmatropic migration of the isomer of **CP1**.

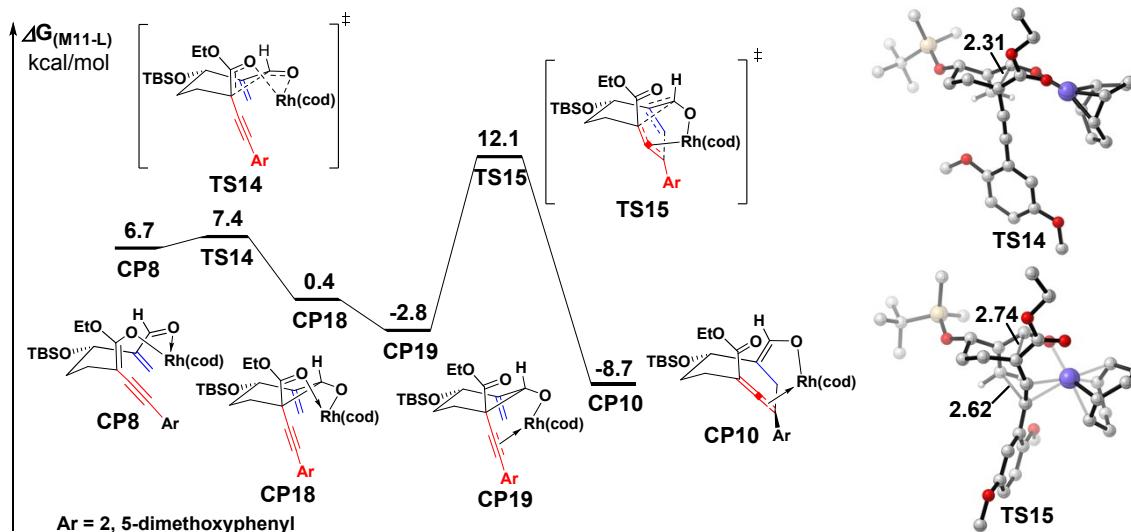

Figure S4. The Gibbs energies profile for 3,3-sigmatropic migration of the isomer of **CP1**.

As shown in Figure S4, the Aldol reaction of intermediate **CP8** occurs via transition state **TS14**, with an energy barrier of 0.7 kcal/mol, to give the allyloxy-rhodium intermediate **CP18**. The coordination of the alkyne group in intermediate **CP18** generates intermediate **CP19**, which is isomer of **CP1**. Then, the intramolecular 3,3-sigmatropic migration from **CP19** to **CP10** occurs via concerted transition state **TS15** with an energy barrier of 14.9 kcal/mol. The activation energy of **TS15** is 0.4 kcal/mol higher than that of **TS9**, which indicates that this 3,3-sigmatropic migration of **CP19** is also unfavorable, but could not be ruled out.

6. Computational Methods.

All DFT calculations were carried out with the GAUSSIAN 09 series of programs. Density functional B3-LYP¹ with a standard 6-31G(d) basis set (LANL08² basis set for Rhodium) was used for geometry optimizations. Harmonic frequency calculations were performed for all stationary points to confirm them as local minima or transition structures and to derive the thermochemical corrections for the enthalpies and Gibbs energies. All minima have zero imaginary frequency and all transition states have only one imaginary frequency. The solvent effects were considered by single point calculations on the gas-phase stationary points with a continuum solvation model SMD.³ The DFT method M11-L⁴

functional with the 6-311+G(d) (LANL08 basis set for Rhodium) basis set was used to calculate the single point energies with trimethylbenzene as solvent and provide highly accurate energy information.⁵ The energies given in this report are the M11-L calculated Gibbs energies in trimethylbenzene solvent. The optimized structures were displayed using CYLview.⁶ In addition, the concentration correction of 1.89 kcal/mol for the G(sol) values was applied to account for the condition change from 1 atm to 1 M concentration when going from gas phase to solution.⁷

7. B3LYP and M06 absolute calculation energies, enthalpies, and free energies.
