## Contents

General procedures: S2-S3.

Synthesis and characterization of dienes 1: S3-S6.

Synthesis and characterization of diesters 6: S7-S12.
Synthesis and characterization of diols 8: S12.

Synthesis and characterization of the Mosher ester 9: S13-S14

Synthesis and characterization of ligand 11 and complex $[\mathrm{Rh}(\mathrm{COD})(\mathbf{1 1})] \mathrm{BF}_{4}:$ S14-S16
Generation and characterization of complex $[\mathrm{Rh}(\mathbf{1 a})\{(S, S) \text {-Me-Duphos }\}]^{+}:$S16-S19.
X-Ray crystal structure determination of diene 1f: S20-S22.

Computational details: S23.

References: S24-S25.

NMR spectra: S26-S51.

Determination of enantiomeric excess (chromatograms and ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\}$ spectra): S52-S61.

## General Procedures

All reactions and manipulations were performed under nitrogen or argon, either in a Braun Labmaster 100 glovebox or using standard Schlenk-type techniques. All solvents were distilled under nitrogen with the following desiccants: sodium-benzophenone-ketyl for diethyl ether $\left(\mathrm{Et}_{2} \mathrm{O}\right)$ and tetrahydrofuran (THF); sodium for $n$ hexane and toluene; $\mathrm{CaH}_{2}$ for dichloromethane $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$; and $\mathrm{NaO}{ }^{\mathrm{i}} \mathrm{Pr}$ for isopropanol ( ${ }^{\mathrm{i} P O H}$ ). (Z)-1-Iodo-alken-2-yl acetates $\mathbf{2 b}$ - $\mathbf{j}$ were synthesized by procedures described
in the literature, ${ }^{\text {S1 }}$ Complexes $[\mathrm{Rh}(\mathrm{NBD})(\mathrm{P}-\mathrm{OP})] \mathrm{BF}_{4}(\mathrm{P}-\mathrm{OP}=$ phosphine-phosphite; 3a3c), ${ }^{\mathrm{S} 2}\left[\mathrm{NiCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right],{ }^{\mathrm{S} 3}$ and $[\mathrm{AuCl}(\mathrm{IPr})](\mathrm{IPr}=1,3-$ bis(diisopropylphenyl)imidazol-2ylidene) ${ }^{S 4}$ were prepared as described previously. All other reagents were purchased from commercial suppliers and used as received. IR spectra were recorded on PerkinElmer 1720-XFT or Bruker Vector 22 spectrometers. NMR spectra were obtained on Bruker DPX-300, DRX-400, or DRX-500 spectrometers. ${ }^{31}$ P $\left\{{ }^{1} \mathrm{H}\right\}$ NMR shifts were referenced to external $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$, while ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ and ${ }^{1} \mathrm{H}$ shifts were referenced to the residual signals of deuterated solvents. All data are reported in ppm downfield from $\left(\mathrm{CH}_{3}\right)_{4} \mathrm{Si}$. All NMR measurements were carried out at $25^{\circ} \mathrm{C}$, unless otherwise stated. HPLC analyses were performed by using a Waters 2690 chromatograph. HPLC analyses were performed at $30^{\circ} \mathrm{C}$. HRMS data were obtained on a JEOL JMS-SX 102A, Thermo Orbitrap Elite or Thermo QExactive mass spectrometers in the General Services of Universidad de Sevilla (CITIUS). Optical rotations were measured on a Perkin-Elmer Model 341 polarimeter.

## Synthesis and Characterization of Dienes 1

Synthesis of (Z,Z)-hexa-2,4-diene-2,5-diyl diacetate (1a): 2,4-Hexadiyne $(0.079 \mathrm{~g} ; 1 \mathrm{mmol})$, acetic acid ( $0.154 \mathrm{~mL} ; 2 \mathrm{mmol}),[\mathrm{AuCl}(\mathrm{IPr})](0.019 \mathrm{~g} ; 0.05 \mathrm{mmol})$, $\mathrm{AgPF}_{6}(0.012 \mathrm{~g} ; 0.05 \mathrm{mmol})$ and toluene ( 3 mL ) were introduced into a Teflon-capped sealed tube, and the reaction mixture was stirred at $120^{\circ} \mathrm{C}$ for 18 h in the absence of light. The solvent was then removed in vacuo and the resulting oily residue purified by flash column chromatography over silica gel using diethyl ether/ $n$-hexane (1:5) as eluent. White solid. Yield: $0.059 \mathrm{~g}(60 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=5.64(\mathrm{~s}, 2 \mathrm{H},=\mathrm{CH})$,
$2.18\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 1.95\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm} .{ }^{13} \mathrm{C}\left\{{ }^{\mathrm{I}} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=168.5,145.9$, 109.8, 20.8, 19.8 ppm. IR (KBr): $v=1738(\mathrm{~s}, \mathrm{C}=\mathrm{O}), 1652(\mathrm{~m}, \mathrm{C}=\mathrm{C}) \mathrm{cm}^{-1}$. HRMS (ESI): $\mathrm{m} / \mathrm{z}$ 221.0787, $\left[\mathrm{M}+\mathrm{Na}^{+}\right]$(calcd for $\mathrm{C}_{10} \mathrm{H}_{14} \mathrm{O}_{4} \mathrm{Na}: 221.0784$ ).

## General procedure for the preparation of the 1,3-diene-1,4-diyl diacetates

 1b-j. A suspension of $\left[\mathrm{NiCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}\right](0.065 \mathrm{~g}, 0.1 \mathrm{mmol}), \mathrm{NaI}(0.015 \mathrm{~g}, 0.1 \mathrm{mmol})$ and Zn dust $(0.105 \mathrm{~g}, 1.6 \mathrm{mmol})$ in THF ( 5 mL ) was stirred at room temperature for 30 min . After this time, a solution of the corresponding ( $Z$ )- $\beta$-iodoenol acetate $\mathbf{2 b} \mathbf{- j}(1 \mathrm{mmol})$ in THF ( 2 mL ) was added and the resulting mixture further stirred at r.t. for 16 hours. The solvent was then removed in vacuo, and the crude reaction mixture purified by column chromatography over silica gel using $n$-hexane/diethyl ether (10:1) as eluent. The corresponding dienes $\mathbf{1 b}-\mathbf{j}$ were obtained as pure $Z, Z$ isomers in $71-89 \%$ yield.(Z,Z)-Deca-4,6-diene-4,7-diyl diacetate (1b): White solid. Yield: 0.104 g $(82 \%) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 300 \mathrm{MHz}\right): \delta=5.64(\mathrm{~s}, 2 \mathrm{H},=\mathrm{CH}), 2.24(\mathrm{t}, J(\mathrm{H}-\mathrm{H})=7.5 \mathrm{~Hz}$, $\left.4 \mathrm{H}, \mathrm{CH}_{2}\right), 2.19\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 1.53-1.41\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 0.91(\mathrm{t}, J(\mathrm{H}-\mathrm{H})=7.2 \mathrm{~Hz}, 6 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right)$ ppm. ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta=168.6,149.7,109.2,35.6,20.7,19.9$, $13.5 \mathrm{ppm} . \mathrm{IR}(\mathrm{KBr}): v=1750(\mathrm{~s}, \mathrm{C}=\mathrm{O}), 1645(\mathrm{~m}, \mathrm{C}=\mathrm{C}) \mathrm{cm}^{-1}$. ## Synthesis and Characterization of Diesters 6

Representative process for asymmetric hydrogenation. In a glovebox, a solution of $\mathbf{5 b}(0.33 \mathrm{mg}, 0.50 \mu \mathrm{~mol})$ and substrate $\mathbf{1 c}(14.2 \mathrm{mg}, 0.050 \mathrm{mmol})$ in $1,2-$ dichloroethane $(0.5 \mathrm{~mL})$ was placed in a HEL CAT-18 or in a HEL 16 mL reactors. The reactor was purged with hydrogen and finally pressurized at 20 bar. The reaction was heated at $40^{\circ} \mathrm{C}$ and magnetically stirred for 24 h . Then, the reactor was depressurized and the resulting solution slowly evaporated under vacuum. The remaining residue was readily analyzed by ${ }^{1} \mathrm{H}$ NMR to determine conversion, as hydrogenations cleanly proceeded to products 6 . Then it was dissolved in a $i-\mathrm{PrOH} / n$-hexane $1: 10$ mixture and passed through a short pad of silica gel to remove catalyst decomposition products. The solution obtained was carefully evaporated and the residue obtained was analyzed by chiral GC or HPLC to determine enantiomeric excess and diastereomeric ratio, with the exception of $\mathbf{6 d}$, as described below. Racemic mixtures were obtained by hydrogenation of $\mathbf{1}$ with $[\mathrm{Rh}(\mathrm{COD})(\mathrm{DiPFc})] \mathrm{BF}_{4}\left[\mathrm{DiPFc}=1,1^{\prime}\right.$-bis(diisopropylphosphino)ferrocene]. ${ }^{\mathrm{S5}}$

Hexane-2,5-diyl diacetate (6a): GC, Chirasil DEX CB, initial temp $=140^{\circ} \mathrm{C}(5$ min ), then $5^{\circ} \mathrm{C} / \mathrm{min}$ up to $200{ }^{\circ} \mathrm{C}(15 \mathrm{~min}), 20 \mathrm{psi}(\mathrm{He}), \mathrm{t}_{1}=3.9 \mathrm{~min}(S, S), \mathrm{t}_{2}=4.3 \mathrm{~min}$ $(R, S), \mathrm{t}_{3}=4.6 \mathrm{~min}(R, R)$.

## Determination of configuration of products 6

Configuration of $\mathbf{6 a}$ was determined by comparison of GC data with an authentic sample of ( $S, S$ )-hexane-2,5-diyl diacetate. For compounds $\mathbf{6 b} \mathbf{- 6 e}$ and $\mathbf{6 i} \mathbf{i} \mathbf{- 6 j}$ configuration was assigned by analogy. For compound $\mathbf{6 h}$, configuration was determined by
conversion into the corresponding enantiopure alcohol $(S, S)-\mathbf{8 h}$ and comparison of optical rotation with that reported in the literature. ${ }^{\text {S6 }}$

## Synthesis and Characterization of Diols 8

$(\boldsymbol{R}, \boldsymbol{R})$-5,8-Dodecanediol (8c): to a solution of diacetate $\mathbf{6 c}(0.268 \mathrm{~g}, \mathrm{dr}=80: 20$; $95 \%$ ee, corresponding to 0.69 mmol of the $C_{2}$ isomers) in $\mathrm{MeOH}(5 \mathrm{~mL})$ was added $\mathrm{K}_{2} \mathrm{CO}_{3}$ ( $390 \mathrm{mg}, 2.8 \mathrm{mmol}$ ) and the resulting mixture stirred for 18 h . Deionized water $(10 \mathrm{~mL})$ was added and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 10 \mathrm{~mL})$. Organic phases were collected, dried over $\mathrm{MgSO}_{4}$ and solvent evaporated under reduced pressure, giving a mixture of $(R, R)$ - and $(R, S)-\mathbf{8 c}$ as a white foamy solid. Subsequent crystallization in a $n$-hexane $/ i$ - $\operatorname{PrOH}(90: 10)$ mixture yielded $(R, R)-8 \mathbf{c}$ as a white solid $(0.102 \mathrm{~g}, 0.50 \mathrm{mmol}, 72 \%) .[\alpha]_{\mathrm{D}}{ }^{20}=-12.4^{\circ}\left(c \quad 1.0, \mathrm{CHCl}_{3}\right) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}): \delta=3.57(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}), 3.25(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OH}), 1.62\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.41\left(\mathrm{~m}, 14 \mathrm{H}, \mathrm{CH}_{2}\right)$, $0.89\left(\mathrm{t}, J(\mathrm{H}-\mathrm{H})=7.1 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=72.4$, 37.5, 34.2, 27.9, 22.8, 14.1 ppm ; Elem. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{26} \mathrm{O}_{2}$ : C $71.23 \%$, H 12.95 \%; found: C 71.14\%, H 12.60\%.
(S,S)-1,6-Diphenyl-2,5-hexanediol (8h): A sample of $\mathbf{6 h}(0.193 \mathrm{~g}, \mathrm{dr}=74: 26$, $95 \%$ ee, corresponding to 0.40 mmol of the $C_{2}$ isomers), was deacylated as described in the procedure for $\mathbf{8 c}$. A careful recrystallization of diol $\mathbf{8 h}$ in a $n$-hexane $/ i-\mathrm{PrOH}$ (10:90) mixture, allowed to separate less soluble $(R, S)-\mathbf{8 h}$ isomer. Final evaporation of the mother liquor led to $(S, S)$-8h as a white solid ( $0.085 \mathrm{~g}, 0.31 \mathrm{mmol}, 77 \%$ ). Spectroscopic data for this compound agree with literature data. ${ }^{\text {S6 }}$

## Mosher ester of diol 8d (9)

This analysis has been performed with two samples (A and B) of 8d. Sample A was obtained by deprotection of diester 6d obtained by non-enantioselective hydrogenation of 1d with $\left[\mathrm{Rh}(\mathrm{COD})\left(\mathrm{DiPFc}^{2}\right)\right] \mathrm{BF}_{4}$. Sample B was obtained by deprotection of diester $\mathbf{6 d}$ obtained by the enantioselective hydrogenation of $\mathbf{1 d}$ with $\mathbf{5 b}$ under our standard conditions. Sample A of $\mathbf{8 d}(0.020 \mathrm{~g}, 0.077 \mathrm{mmol})$ was dried azeotropically with toluene ( $2 \times 5 \mathrm{~mL}$ ) and the residue obtained dissolved in DCM (2 $\mathrm{mL})$. Over this solution it is added pyridine ( $0.025 \mathrm{~mL}, 0.308 \mathrm{mmol}$ ) and ( $R$ )-3,3,3-trifluoro-2-methoxy-2-phenylpropanoyl chloride $(0.047 \mathrm{~g}, 0.19 \mathrm{mmol})$. The resulting mixture is stirred for 4 h , evaporated under reduced pressure and the resulting oil dissolved in a $\mathrm{Et}_{2} \mathrm{O} / n$-hexane (1:9) mixture and filtered through a short pad of silica. The solution obtained was evaporated to yield the diester rac-9 as a colorless oil (0.047 $\mathrm{g}, 89 \%)$. For the analysis of product of enantioselective hydrogenation of $\mathbf{1 d}$ with $\mathbf{5 d}$ it was followed an analogous procedure starting with sample B. Below is detailed the characterization of rac-9, while isomer assignation has been done by comparison with spectra of enantioenriched $9 .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=7.55(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.40$ (m, 6H, Ar-H), 5.05 (m, 2H, CH), 3.57 ( $\mathrm{s}, 6 \mathrm{H}, \mathrm{OCH}_{3}$ ), 1.56 (m, 8H, $\mathrm{CH}_{2}$ ), 1.23 (m, $\left.16 \mathrm{H}, \mathrm{CH}_{2}\right), 0.89\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm} ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ : Isómer $R, R, R, R: \delta=166.3(2 \mathrm{C}=\mathrm{O}), 132.4\left(2 \mathrm{C}_{\mathrm{q}}\right.$ arom), 129.6 ( 2 CH arom), 128.4 ( 4 CH arom), $127.3(4 \mathrm{CH}$ arom $), 123.0\left(\mathrm{q}, J(\mathrm{C}-\mathrm{F})=289 \mathrm{~Hz}, 2 \mathrm{CF}_{3}\right), 84.4\left(\mathrm{q}, J(\mathrm{C}-\mathrm{F})=28 \mathrm{~Hz}, 2 \mathrm{C}_{\mathrm{q}}{ }^{-}\right.$ $\mathrm{Ph}), 76.8(2 \mathrm{OCH}), 55.4\left(2 \mathrm{OCH}_{3}\right), 33.7\left(2 \mathrm{CH}_{2}\right), 31.6\left(2 \mathrm{CH}_{2}\right), 29.0\left(2 \mathrm{CH}_{2}\right), 28.7(2$ $\left.\mathrm{CH}_{2}\right)$, $25.0\left(2 \mathrm{CH}_{2}\right), 22.5\left(2 \mathrm{CH}_{2}\right), 14.0\left(2 \mathrm{CH}_{3}\right) \mathrm{ppm}$; Isómer $R, S, S, R: \delta=166.2(2$ $\mathrm{C}=\mathrm{O}), 132.3\left(2 \mathrm{C}_{\mathrm{q}}\right.$ arom), 129.6 ( 2 CH arom), $128.4(4 \mathrm{CH}$ arom), 127.3 ( 4 CH arom), $123.0\left(\mathrm{q}, J(\mathrm{C}-\mathrm{F})=289 \mathrm{~Hz}, 2 \mathrm{CF}_{3}\right), 84.5\left(\mathrm{q}, J(\mathrm{C}-\mathrm{F})=28 \mathrm{~Hz}, 2 \mathrm{C}_{\mathrm{q}}-\mathrm{Ph}\right), 55.4\left(2 \mathrm{OCH}_{3}\right)$, $33.6\left(2 \mathrm{CH}_{2}\right)$, $31.6\left(2 \mathrm{CH}_{2}\right), 29.6\left(2 \mathrm{CH}_{2}\right)$, $28.9\left(2 \mathrm{CH}_{2}\right)$, $24.7\left(2 \mathrm{CH}_{2}\right)$, $22.5\left(2 \mathrm{CH}_{2}\right)$,
$14.0\left(2 \mathrm{CH}_{3}\right) \mathrm{ppm}$; signals of methyne carbons of this isomer have not been observed due to overlap with solvent signal; ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}, 565 \mathrm{MHz}\right): \delta=-71.11$ ( $R, R, S, R$ ), -71.12 ( $R, R, R, R$ ), -71.15 ( $R, R, S, R$ ), -71.20 ( $R, S, S, R$ ) ppm; HRMS (ESI): $m / z$ $713.3243[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\mathrm{C}_{36} \mathrm{H}_{48} \mathrm{O}_{6} \mathrm{~F}_{6} \mathrm{Na}: 713.3247$ ).

## (S,S)-Bis-1,2(2,5-di-n-butylphospholane)benzene (11)

(a) $(R, R)-5,8$-Dodecanediol cyclic sulphate (10): over a solution of diol $(R, R)$ $\mathbf{8 c},(140 \mathrm{mg}, 0.69 \mathrm{mmol})$ in $\mathrm{DCM}(3 \mathrm{~mL})$ cooled at $0^{\circ} \mathrm{C}$ was added $\mathrm{NEt}_{3}(0.290 \mathrm{~mL}, 2.0$ $\mathrm{mmol})$ and $\mathrm{SOCl}_{2}(0.060 \mathrm{~mL}, 1.4 \mathrm{mmol})$. The mixture was left to warm to room temperature, stirred for 2 h and evaporated under reduced pressure. The residue obtained was dissolved in a $n$-hexane:DCM (4:1) mixture and filtered through a short pad of silica. The solution obtained was evaporated giving an orange residue which was used without further purification for the next step. The mentioned residue was dissolved in a mixture of DCM ( 2 mL ), acetonitrile ( 2 mL ) and water ( 3 mL ). The mixture was cooled down to $0{ }^{\circ} \mathrm{C}$ and hydrated $\mathrm{RuCl}_{3}(1.1 \mathrm{mg}, 0.005 \mathrm{mmol})$ and $\mathrm{NaIO}_{4}(226.7 \mathrm{mg}$, $1.1 \mathrm{mmol})$ were added. The reaction was kept on stirring for 2 h and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 10 \mathrm{~mL})$. Ethereal phases were collected, dried over $\mathrm{MgSO}_{4}$, resulting solution evaporated giving an oily residue which was crystallized in a $n$-hexane: $\mathrm{Et}_{2} \mathrm{O}(10: 90)$ mixture to give corresponding cyclic sulphate of $(R, R)$-10 as a white solid. $[\alpha]_{\mathrm{D}}{ }^{20}=-29^{\circ}$ (c 0.1, THF). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta=4.60(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}), 1.90\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.70\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.37\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{CH}_{2}\right), 0.88\left(\mathrm{t}, J(\mathrm{H}-\mathrm{H})=7.8 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm} ;$ ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta=85.3,35.1,32.9,27.2,22.2,13.8 \mathrm{ppm}$; HRMS (ESI): $m / z 287.1289[\mathrm{M}+\mathrm{Na}]^{+}$(calcd for $\mathrm{C}_{12} \mathrm{H}_{24} \mathrm{O}_{4} \mathrm{NaS}: 287.1288$ ).
(b) (S,S)-Bis-1,2(2,5-di-n-butylphospholane)benzene (11): over a solution of 1,2bisphosphinobenzene ( $26.9 \mathrm{mg}, 0.19 \mathrm{mmol}$ ) in THF ( 3 mL ) was added $n-\mathrm{BuLi}(0.230$ mL 1.6 M solution in hexanes, 0.368 mmol ) and the reaction was stirred for 1.5 h . Then, the cyclic sulphate obtained in the previous step $(R, R) \mathbf{- 1 0}(100 \mathrm{mg}, 0.36 \mathrm{mmol})$ was added, the mixture stirred for 2 h , followed by addition of $n-\mathrm{BuLi}(0.230 \mathrm{~mL} 1.6 \mathrm{M}$ solution in hexanes, 0.368 mmol ) and further stirring for 2 h . The mixture obtained was evaporated resulting a residue which was treated with pentane ( 20 mL ) and filtered through a short pad of silica. Further elution with $\mathrm{Et}_{2} \mathrm{O}$ afforded a solution, which upon evaporation yielded $\mathbf{1 1}$ as a colorless oil $(115 \mathrm{mg}, 89 \%) .[\alpha]_{\mathrm{D}}{ }^{20}=+255^{\circ}(c 0.2$, THF $)$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}, 500 \mathrm{MHz}\right): \delta=7.40(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 7.10(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Ar}-\mathrm{H}), 2.52(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CH}), 2.31(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}), 2.15\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.99\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.75\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{CH}_{2}\right), 1.36$ $\left(\mathrm{m}, 20 \mathrm{H}, \mathrm{CH}_{2}\right), 0.98\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 0.94\left(\mathrm{t}, J(\mathrm{H}-\mathrm{H})=7.0 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right), 0.84(\mathrm{t}, J(\mathrm{H}-\mathrm{H})$ $\left.=7.0 \mathrm{~Hz}, 6 \mathrm{H}, \mathrm{CH}_{3}\right) \mathrm{ppm} ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \operatorname{NMR}\left(\mathrm{C}_{6} \mathrm{D}_{6}, 162 \mathrm{MHz}\right): \delta=-3.8 \mathrm{ppm} ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.\mathrm{C}_{6} \mathrm{D}_{6}, 125 \mathrm{MHz}\right): \delta=144.9\left(2 \mathrm{C}_{\mathrm{q}}\right), 132.0(2 \mathrm{CH}$ arom), $127.7(2 \mathrm{CH}$ arom), 40.0 $\left(\right.$ virt $\left.\mathrm{t}, J_{\text {app }}(\mathrm{C}-\mathrm{P})=8 \mathrm{~Hz}, 2 \mathrm{CH}\right), 39.4(2 \mathrm{CH}), 36.1\left(\right.$ virt $\left.\mathrm{t}, J_{\text {app }}(\mathrm{C}-\mathrm{P})=16 \mathrm{~Hz}, 2 \mathrm{CH}_{2}\right), 33.6$ $\left(2 \mathrm{CH}_{2}\right), 33.3\left(2 \mathrm{CH}_{2}\right), 32.4\left(2 \mathrm{CH}_{2}\right), 32.0\left(\right.$ virt $\left.\mathrm{t}, J_{\text {app }}(\mathrm{C}-\mathrm{P})=6 \mathrm{~Hz}, 2 \mathrm{CH}_{2}\right), 31.8($ virt t , $\left.J_{\text {app }}(\mathrm{C}-\mathrm{P})=4 \mathrm{~Hz}, 2 \mathrm{CH}_{2}\right)$, $23.1\left(2 \mathrm{CH}_{2}\right)$, $22.8\left(2 \mathrm{CH}_{2}\right), 14.0\left(4 \mathrm{CH}_{3}\right)$ ppm; HRMS (ESI) $m / z: 475.3615[\mathrm{M}+\mathrm{H}]^{+}$(calcd for $\mathrm{C}_{30} \mathrm{H}_{53} \mathrm{P}_{2}: 475.3617$ ).

## Generation and Characterization of complex $[\operatorname{Rh}(1 a)\{(S, S)-M e-D u p h o s\}]^{+}$

In a Wilmad quick pressure valve NMR tube was introduced a solution of $[\operatorname{Rh}(\mathrm{COD})\{(S, S)-\mathrm{Me}-$ Duphos $\}] \mathrm{BF}_{4}$ in $\mathrm{MeOH}(0.5 \mathrm{~mL})$. The tube was pressurized with 4 bar $\mathrm{H}_{2}$ and heated at $40^{\circ} \mathrm{C}$ for 1 h . At this point full conversion was observed by ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR. The tube was then depressurized introduced in a glove-box and the solution transferred to an ampoule. Then was added $\mathbf{1 a}(10 \mathrm{mg}, 0.05 \mathrm{mmol})$ and the resulting solution stirred for 15 min and evaporated. The residue was further dried with additional portions of DCM ( $3 \times 2 \mathrm{~mL}$ ). Finally, the residue obtained was dissolved in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ and the solution transferred to a NMR tube.

Figure S1. ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (202 MHz, $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ) of $[\mathrm{Rh}(\mathbf{1 a})\{(\mathrm{S}, \mathrm{S})-\mathrm{Me}-$ Duphos $\}] \mathrm{BF}_{4}$. M and m denote major and minor isomers, respectively, while $S$ corresponds to remaining $[\operatorname{Rh}\{(S, S)-\mathrm{Me}-$ Duphos $\left.\}(\mathrm{MeOH})_{2}\right] \mathrm{BF}_{4}$.

Figure S5. Selected region of the ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ NOESY experiment ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, 263 \mathrm{~K}$ ) of $[\operatorname{Rh}(1 \mathbf{a})\{(\mathrm{S}, \mathrm{S})-\mathrm{Me}-$ Duphos $\}] \mathrm{BF}_{4}$. Structurally meaningful signals are marked with 1 and 2.

## X-Ray crystal structure determination of diene 1f

Crystals suitable for X-ray diffraction analysis were obtained by slow diffusion of hexane into a saturated solution of $\mathbf{1 f}$ in ethyl acetate. The most relevant crystal and refinement data are collected in Table S1, and an ORTEP-type view of the structure with selected structural parameters is given in Figure S6. Diffraction data were recorded on an Oxford Diffraction Xcalibur Nova single-crystal diffractometer, using $\mathrm{Cu}-\mathrm{K} \alpha$ radiation ( $\lambda=1.5418 \AA$ ), with a crystal-to-detector distance fixed at 62 mm and using the oscillation method, with $1^{\circ}$ oscillation and variable exposure time per frame of $2.0-$ 9.0 s. The data collection strategy was calculated with the program CrysAlis Pro CCD. ${ }^{\text {S7 }}$ Data reduction and cell refinement was performed with the program CrysAlis Pro RED. ${ }^{\text {S7 }}$ Empirical absorption correction was applied by means of SCALE3 ABSPACK algorithm as implemented in the program CrysAlis Pro RED. ${ }^{\text {S7 }}$ The software package WINGX was used for space group determination, structure solution and refinement. ${ }^{\text {S8 }}$ The structure was solved by direct methods using SHELXL97. ${ }^{\text {S9 }}$ Isotropic least-squares refinement on $F^{2}$ using SHELXL97 was performed. ${ }^{\text {S9 }}$ During the final stages of the refinement, all the positional parameters and the anisotropic temperature factors of all the non- H atoms were refined. The coordinates of the H atoms were found from different Fourier maps, and included in the refinement with isotropic parameters. The function minimized was $\left[\Sigma w\left(F_{\mathrm{o}}{ }^{2}-F_{\mathrm{c}}{ }^{2}\right) / \Sigma w\left(\mathrm{~F}_{\mathrm{o}}{ }^{2}\right)\right]^{1 / 2}$ where $w=1 /\left[\sigma^{2}\left(F_{\mathrm{o}}{ }^{2}\right)+(0.0532 P)^{2}+\right.$ $0.2099 P$ ] with $\sigma\left(F_{\mathrm{o}}^{2}\right)$ from counting statistics and $P=\left(\operatorname{Max}\left(F_{\mathrm{o}}^{2}, 0\right)+2 \mathrm{~F}_{\mathrm{c}}{ }^{2}\right) / 3$. Supplementary crystallographic data for the structural analysis have been deposited with the Cambridge Crystallographic Data Centre, CCDC-1869873.

Figure S6. ORTEP-type view of the structure of compound if showing the crystallographic labelling scheme. Hydrogen atoms, except those on $\mathrm{C}(4)$ and $\mathrm{C}(4 \mathrm{a})$, have been omitted for clarity. Those atoms labelled with "a" are generated by symmetry. Thermal ellipsoids are drawn at $30 \%$ probability level. Selected bond lengths (Å): $\mathrm{C}(1)-\mathrm{O}(1) 1.365(2), \mathrm{C}(1)-\mathrm{O}(2) 1.199(2), \mathrm{C}(1)-\mathrm{C}(2) 1.488(2), \mathrm{C}(3)-\mathrm{O}(1) 1.410(2)$, $\mathrm{C}(3)-\mathrm{C}(4) 1.330(2), \mathrm{C}(3)-\mathrm{C}(5) 1.493(2), \mathrm{C}(4)-\mathrm{C}(4 \mathrm{a}) 1.449(3)$. Selected bond angles $\left({ }^{\circ}\right)$ : $\mathrm{O}(1)-\mathrm{C}(1)-\mathrm{O}(2) 122.7(2), \mathrm{O}(1)-\mathrm{C}(1)-\mathrm{C}(2) 110.7(2), \mathrm{O}(2)-\mathrm{C}(1)-\mathrm{C}(2) 126.6(2), \mathrm{C}(1)-$ $\mathrm{O}(1)-\mathrm{C}(3) 117.9(1), \mathrm{O}(1)-\mathrm{C}(3)-\mathrm{C}(4) 119.3(1), \mathrm{O}(1)-\mathrm{C}(3)-\mathrm{C}(5) 114.3(1), \mathrm{C}(3)-\mathrm{C}(5)-\mathrm{C}(6)$ 114.5(1), C(3)-C(5)-C(9) 116.1(1), C(3)-C(4)-C(4a) 125.3(2).

## Computational details

Calculations were performed with Gaussian $09^{\text {S10 }}$ at the DFT level, using the Becke Three-Parameter functional ${ }^{\text {S11 }}$ with the non-local correlation by Perdew and Wang ${ }^{\text {S12 }}$ (B3PW91) and the D3 version of Grimme's dispersion with Becke-Johnson damping (GD3BJ). ${ }^{\mathrm{S} 13} \mathrm{H}, \mathrm{C}, \mathrm{P}$ and O atoms were represented with the $6-31 \mathrm{G}(\mathrm{d}, \mathrm{p})$ basis set $^{\text {S14 }}$ whereas Rh atoms were described by the Stuttgart/Dresden Effective Core Potential and the associated basis set as implemented in Gaussian 09. ${ }^{\text {S15 }}$ All molecular geometries were optimized within the SMD continuum solvent (1,2-dichloroethane) model ${ }^{\text {S16 }}$ without any geometry constrains. Frequency calculations were performed at the same level of theory to characterize the stationary points as minima (no imaginary frequencies) or saddle points (transition states, one imaginary frequency), as well as to calculate the Zero-point energy, enthalpy $(\mathrm{H})$ and free energy $(\mathrm{G})$ corrections. The two minima connected by a given transition state were confirmed from vibrational analysis. Energies of calculated structures are given in the Table below:

| Coord. Mode | E (RB3PW91) a.u. | Free Energy (298 K), a.u. |
| :--- | :---: | :---: |
| A | $-2186,166901$ | $-2185,581922$ |
| B | $-2186,166189$ | $-2185,581116$ |
| C | $-2186,154027$ | $-2185,568504$ |
| D | $-2186,14196$ | $-2185,557408$ |
| E | $-2186,142411$ | $-2185,555756$ |
| F | $-2186,148372$ | $-2185,560916$ |
| G | $-2186,149938$ | $-2185,564282$ |

| 3 | 16.834 | BB | 0.0642 | 79.17769 | 25.84625 |

## Hexadecan-7,10-diyl diacetate (6d)

Comparison of ${ }^{19} \mathrm{~F}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra of Mosher esters of diols resulting from deprotection of product of non asymmetric hydrogenation of 1d (top) and of hydrogenation of $\mathbf{1 d}$ with $\mathbf{5 b}$ (bottom). Signals marked with an asterisk $\left({ }^{*}\right)$ correspond to Mosher diester of meso-10d, characterized by two unequivalent $\mathrm{CF}_{3}$ groups. Numerical values correspond to integrals of signals: (i) $R, R, R, R$ isomer overlapped with one of the signals of the meso isomer, (ii) second signal of the meso isomer and (iii) $R, S, S, R$ isomer. From data of the bottom spectrum a value of $(R, R, R, R) /(R, S, S, R)=$ $(85.00-13.22) / 1.77=40.55$ can be obtained, corresponding to a $95 \%$ ee of the parent ester $\mathbf{6 d}$.

## 2,11-Dimethyl-dodecan-5,8-diyl diacetate (6e)

Hydrogenation with achiral catalyst

| $\begin{gathered} \text { Peak } \\ \# \end{gathered}$ | RetTime [min] | Type | Width <br> [min] | $\begin{array}{r} \text { Area } \\ {\left[\mathrm{pA}{ }^{*} \mathrm{~s}\right]} \end{array}$ | Height [pA] | $\begin{gathered} \text { Area } \\ \% \end{gathered}$ |
