Fig. S9 Photomicrographs of $\mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$, showing the dehydration process at (a) $25^{\circ} \mathrm{C}$, (b) $160^{\circ} \mathrm{C}$ and (c) $180^{\circ} \mathrm{C}$.

Fig. S10 The PXRD pattern of the crystalline material obtained after heating $\mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{2} \mathbf{O}$ to $160^{\circ} \mathrm{C}$.

Fig. S11 DSC and TG curve of $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$.
$\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ shows two significant energy change. The first significant end othermic peak corresponds to the transformation from $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ to $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}$, which is in accordance with the TGA analysis, in which the first weight loss in the temperature range from $107.6^{\circ} \mathrm{C}$ to $122.8^{\circ} \mathrm{C}$ corresponding to water loss (cal. $4.8 \%$, exp. $4.3 \%$ ), and the second endothermexothermic peaks occurs corresponding to melting-crystallization process. The onset temperature is $171.6^{\circ} \mathrm{C}$ which corresponding to the melting point of $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{1}$

Fig. S12 DSC and TG curve of $\mathbf{A}_{1} \mathbf{B}_{1}$.
$\mathbf{A}_{1} \mathbf{B}_{1}$ shows an endothermic transition over the range $171.1^{\circ} \mathrm{C}$ to $181.6^{\circ} \mathrm{C}$. The onset temperature is $171.1^{\circ} \mathrm{C}$ which corresponding to the melting point of $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{1}$. Above this transition it observes an exothermic peak, which belongs to a classic meltingcrystallization process.

Fig. S13 DSC and TG curve of $\mathbf{A}_{1} \mathbf{B}_{\mathbf{2}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$.
$\mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{2} \mathbf{O}$ shows a bit complicated curve. The first endothermic peak at $165.5{ }^{\circ} \mathrm{C}$ corresponds to the process of water loss, which is also observed in TGA curve (cal. 3.5\%, exp. $3.7 \%$ ). After $170{ }^{\circ} \mathrm{C}, \mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{2} \mathbf{O}$ completely changed to $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{2}$. Then endothermexothermic peaks occur also corresponding to melting-crystallization process. The onset temperature is $174.1^{\circ} \mathrm{C}$ which corresponding to the melting point of $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{2}$.

Fig. S14 DSC and TG curve of $\mathbf{A}_{1} \mathbf{B}_{2}$.
$\mathbf{A}_{1} \mathbf{B}_{2}$ has an endothermic reaction starting on $174.1^{\circ} \mathrm{C}$ corresponding to melting point, and then follows an exothermic process corresponding to crystallization.

Fig. S15 Percentage contributions to the Hirshfeld surface area for the various close intermolecular contacts. Percentages are given on the histogram only for the major atom-type/atom-type contacts discussed in detail in the text.

Fig. S16 2D fingerprint plot derived from the Hirshfeld surface.
In $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ and $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}, \mathbf{A}$ molecule can act as donors and acceptors simultaneously, thus two symmetric sharp spikes projecting along the diagonal of the plot can be seen in Hirshfeld surface (top), with one corresponding to the COOH as donors and the other corresponds to $\mathrm{CO}_{2} / \mathrm{SO}_{3}$ groups as acceptors. In $\mathbf{A}_{1} \mathbf{B}_{1} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$, the upper peak is associated with the interactions between COOH group (as donor) and water ( $\mathrm{O}-$ $\mathrm{H} \cdots \mathrm{O}_{\text {(water) }}$ ), whereas the lower one is the interactions that $\mathrm{COO} / \mathrm{SO}_{3}$ groups as acceptors linking to N in $\mathbf{B}$ cations $\left(\mathrm{N}_{(\mathbf{B})}-\mathrm{H}^{\cdots} \mathrm{O}\right)$ and water molecules $\left(\mathrm{O}_{(\text {water })}-\right.$ $\mathrm{H} \cdots \mathrm{O})$. For $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{1}$, the upper peak is associated with the interactions between COOH donor and $\mathrm{SO}_{3}$ group in another $\mathbf{A}$ anion ( $\mathrm{O}-\mathrm{H}^{\cdots} \mathrm{O}_{(\mathbf{A})}$ ), whereas the lower peak represents the interactions with $\mathrm{CO}_{2}$ and $\mathrm{SO}_{3}$ as acceptors $\mathrm{O} \cdots \mathrm{H}-\mathrm{O}_{(\mathbf{A})} / \mathrm{O} \cdots \mathrm{H}-\mathrm{N}_{(\mathbf{B})}$. The difference between $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ and $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{1}}$ is the middle sharp thin spike of $\mathbf{A}_{1} \mathbf{B}_{1} \cdot \mathbf{H}_{2} \mathbf{O}$, representing the $\mathrm{H} \cdots \mathrm{H}$ interactions, which was further ascertained from the percentage contribution calculations to the Hirshfeld surface area for the various close intermolecular contacts (Fig. S15), in which $\mathrm{H} \cdots \mathrm{H}$ interaction are the subdominant contribution to Hirshfeld surface. It is worth mentioning that $\mathrm{H} \cdots \mathrm{H}$ interaction in $\mathbf{A}_{1} \mathbf{B}_{1} \cdot \mathbf{H}_{2} \mathbf{O}$ accounts for $27.5 \%$, which is highest among all the structures.

The derived fingerprint plots of $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{2}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ and $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{2}}$ are relatively simple with only one spike projecting along the diagonal of the plot (bottom), which is in accordance with the fact that $\mathbf{A}$ molecules can only be acted as hydrogen bonding acceptors in these structures. Hirshfeld surface calculation reveals that these interactions in both structures are equally contributing $54.7 \%$ to all surface interactions. But it is obvious that the spike in $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{\mathbf{2}} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$ is sharper and longer than that in $\mathbf{A}_{\mathbf{1}} \mathbf{B}_{2}$, which might due to the two kinds of interactions involved in $\mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{2} \mathbf{O}\left(\mathrm{~N}_{(\mathbf{B})}-\mathrm{H}^{\cdots} \mathrm{O}\right.$ and $\left.\mathrm{O}_{(\text {water })}-\mathrm{H}^{\cdots} \mathrm{O}\right)$, whereas only one kind of interaction in $\mathbf{A}_{1} \mathbf{B}_{2}\left(\mathrm{~N}_{(\mathbf{B})}-\mathrm{H}^{\cdots} \mathrm{O}\right)$.

Table S1 Hydrogen bonds of $\mathbf{A}_{1} \mathbf{B}_{1} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}, \mathbf{A}_{1} \mathbf{B}_{1}, \mathbf{A}_{1} \mathbf{B}_{2} \cdot \mathbf{H}_{\mathbf{2}} \mathbf{O}$, and $\mathbf{A}_{1} \mathbf{B}_{2}$.
