## General Information

All reagents and solvents were obtained from commercial suppliers and used without further purification. The synthesis of compound **1** was performed according to the previously reported literature.<sup>1</sup> <sup>1</sup>H and <sup>13</sup>C NMR spectra were performed on a Bruker AV400 spectrometer in CDCl<sub>3</sub> using tetramethylsilane as an internal standard at 298 K. X-ray crystal structure data were collected using a Bruker D8 VENTURE diffractometer with CuK $\alpha$  radiation.

### Single crystal X-ray diffraction experiment for 1·0.5*p*-xylene

The colourless plate crystal ( $0.200 \times 0.120 \times 0.050 \text{ mm}^3$ ), obtained from chloroform/*p*-xylene, was immersed in Paraton-N oil and placed in the  $\text{N}_2$  cold stream at 100 K. The diffraction experiment was performed in a Bruker D8VENTURE system (PHOTON-100 CMOS detector,  $\text{CuK}\alpha$ :  $\lambda = 1.54178 \text{ \AA}$ ). Absorption correction was performed by an empirical method implemented in SADABS.<sup>2</sup> Structure solution and refinement were performed by using SHELXT-2014/5<sup>3</sup> and SHELXL-2016/6<sup>4</sup>.

All non-hydrogen atoms were refined anisotropically. Hydrogen atoms were refined isotropically on the calculated positions using a riding model (AFIX 13, 137, 23 and 43) with  $U_{\text{iso}}$  values constrained to 1.2/1.5  $U_{\text{eq}}$  of their parent atoms.
