#### I. Synthesis of Ionic Liquids

All reagents and solvents were acquired from commercial sources (Acros Organics, 3M and Sigma-Aldrich) and were used as received, without further purification. All reactions were run under nitrogen atmosphere, using oven-dried glassware. NMR spectra were recorded on a JEOL 400 spectrometer and collected as solutions of deuterochloroform (bromide ionic liquids) or deuteroacetone (bistriflate ionic liquids).

A. Synthesis of 1-alkyl-3-methylimidazolium bis[(trifluoromethane)sulfonyl]amide ionic liquids  $[C_nC_1im][NTf_2]$ .

$$\begin{array}{c} & \text{NTf}_2^-\\ & & \text{N} \\ & \underline{-} \\ \end{array} \xrightarrow{N} \frac{1. \text{ R-X, 50 °C, 24 h}}{2. \text{ LiNTf}_2 (\text{aq.})} \xrightarrow{\text{NTf}_2^-} \\ & & \text{N} \\ & & \underbrace{-} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ & & \text{H} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ \xrightarrow{N} \begin{array}{c} & \text{N} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ \xrightarrow{N} \begin{array}{c} & \text{N} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ \xrightarrow{N} \begin{array}{c} & \text{N} \\ \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ \xrightarrow{N} \begin{array}{c} & \text{N} \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \\ \xrightarrow{N} \end{array} \xrightarrow{N} \begin{array}{c} & \text{N} \end{array} \xrightarrow{N} \end{array}$$

Scheme 1. Generic synthesis of  $[C_nC_1im][NTf_2]$  for n = 3-5.

All ionic liquids were synthesized using modified procedures published elsewhere and following the generic scheme presented above.<sup>1,2</sup> The quaternization step was performed at 50 °C, adding a slight excess of the corresponding alkyl bromide (*i.e.*, 1.05 eq.) to ensure complete consumption of 1- methylimidazole. The unreacted halide was removed by repeated washing of the ionic liquid with a 1: 3 (v/v) mixture of dichloromethane and hexanes. The decolorization of the ionic liquid was accomplished at the bromide stage according to an in-house developed protocol (*vide infra*). The metathesis was

performed in presence of aqueous lithium bis[(trifluoromethane)sulfonyl]amide (LiNTf<sub>2</sub>).<sup>3</sup> The lithium bromide formed was removed by repeated washing with triple deionized water until passing the silver nitrate test. The excess water was removed *via* benzene azeotrope, using a Dean-Stark trap. Further drying was carried out under high vacuum at 40 °C and having the water content assessed by Karl-Fischer titration. All final products were colorless liquids at room temperature.

*B.* Synthesis of 1,n-bis(3-methylimidazolium-1-yl)alkane bis[(trifluoromethane)sulfonyl]amide ionic liquids  $[(C_1im)_2C_n][NTf_2]_2$ 

$$\underbrace{N \xrightarrow{1. \text{MeCN}}}_{\text{60 °C}} \underbrace{N \xrightarrow{1. \text{MeCN}}}_{\text{1. n-dibromoalkane}} \underbrace{N \xrightarrow{\text{m}}}_{\text{N}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}} \underbrace{N \xrightarrow{\text{m}}}_{\text{H}_2\text{O}} \underbrace{N \xrightarrow{\text{m}}}_{\text{H}_2\text{O}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}} \underbrace{N \xrightarrow{\text{m}}}_{\text{m}}$$

Scheme 2. Generic synthesis of  $[(C_1im)_2C_n][NTf_2]_2$  for n = 6, 8, and 10.

A two-neck round bottom flask, under nitrogen, equipped with a magnetic stirrer and a condenser, was charged with 50 mL of acetonitrile and 2.1 eq. of 1-methylimidazole. To this closed system, the corresponding dibromoalkane (1 eq.), dissolved in 10 mL of acetonitrile, was delivered dropwise at a rate of 0.34 mL/min with an automatic syringe. The reaction was left under constant stirring at 60 °C until complete consumption of the dibromoalkane. After the completion of the addition, a white slurry was formed. The product,  $[(C_1im)_2C_n][Br]_2$ , was vacuum filtered, rinsed with diethyl ether and then the solvent evaporated in vacuo. The solid formed was further dried on a Schlenk line. The last stage of synthesis was accomplished via metathesis reaction.<sup>3</sup> An aqueous solution of LiNTf<sub>2</sub> (1.98 eq.) was added to the dibromide IL and left to stir overnight. The two-phase system was then repeatedly washed with tripledeionized water until no bromide ions could be detected by the silver nitrate test. The final product,  $[(C_1 im)_2 C_n]$  [NTf<sub>2</sub>]<sub>2</sub>, was dried with a benzene azeotrope. The residual benzene was removed under vacuum. For decolorization, 3 g of activated charcoal and 60 mL of acetonitrile were added to the viscous, slightly yellow IL, and left under stirring for 96 h. The black slurry was then filtered through a gravitational column packed with 10 cm of aluminum oxide (activated, basic, 50-200 micron) and 3 cm of celite 545. The removal of the solvent under reduced pressure afforded the dicationic ionic liquid as a colorless, viscous liquid at room temperature. Yields: 74 - 86%.

### **II. OHD-RIKES Time-Domain Data**

Shown in Figure S1 are semi-logarithmic plots of representative OHD-RIKES signals in the 0-4 ps time range for the neat liquids, CS<sub>2</sub>, MIL(3), and MIL(6), and the mixtures, CS<sub>2</sub>/MIL(3) and CS<sub>2</sub>/DIL(6). The signals are height normalized at the coherent spike at t = 0 in order to compare the decay pattern of the neat liquids to that of the mixtures. The instantaneous electronic response (the coherent spike) is the sharp peak at zero-time delay and the non-instantaneous part is the nuclear response. The OHD-RIKES signal for neat ILs at early times is dominated by the instantaneous electronic component (i.e., coherent spike), in comparison to the non-instantaneous nuclear component. In contrast, for neat CS<sub>2</sub>, the electronic and nuclear components contribute equally to the Kerr response at early times. Because a 50-fs step size is used in the time window between -1 and 4 ps, the rapid oscillations arising the coherent excitation of intramolecular vibration modes of the cation and anion appear in the Kerr transients. In both CS<sub>2</sub>/IL mixtures, the amplitude of the nuclear response relative to that of electronic response increases with the increase in mole fraction of CS<sub>2</sub>.

**Figure S1.** Representative semi-logarithmic plots of the OHD-RIKES signals in the 0-4 ps time range for CS<sub>2</sub>/MIL(3) mixtures, top to bottom mol %: 100, 25, 20, 15, 10, 0. and CS<sub>2</sub>/DIL(6), top to bottom mol %: 100, 40, 33.3, 26, 18.2, 0. Signals have been normalized at the coherent spike at t = 0.

Shown in Figure S2 are representative OHD-RIKES signals in the 0-10 ps time range for neat liquids  $CS_2$ , MIL(3), and DIL(6), and for the mixtures 10 mol.%  $CS_2$ /MIL(3) and 18.2 mol.%  $CS_2$ /DIL(6) mixtures. In the case of neat  $CS_2$ , the long-time part (t > 1 ps) of the nuclear response decays exponentially to baseline. In contrast, for the neat ILs and  $CS_2$ /IL mixtures, the long-time part of the nuclear response decays non-exponentially and is not fully relaxed. OHD-OKE measurements<sup>4-6</sup> over a much longer time range than in the current study indicate that the slow non-exponential relaxation of ILs systems extends to several hundred-ps/sub-ns. These slow dynamics were attributed by Maroncelli and co-workers<sup>7</sup> to the resistance of the charge-ordered structure of the ILs to reorganization.

**Figure S2**. Comparison of representative OHD-RIKES signals in the 0-10 ps time range for (a) the neat CS<sub>2</sub>, 10 mol.% CS<sub>2</sub>/MIL(3), neat MIL(3); and (b) neat CS<sub>2</sub>, 18.2 mol.% CS<sub>2</sub>/DIL(6), neat DIL(6). The signals have been normalized at the coherent spike at t = 0 and vertically shifted by log-base 10 increments for clarity. The solid black lines are fits of eq 1 to OHD-RIKES decay in 1.5-10 ps time range. Dashed lines are the part of the fit associated with the  $\tau_2$ -term and the constant *B* in eq 1. See Table 1 for fit parameters.

### **III. Analysis of the OHD-RIKES Time-Domain Data**

The first step in the procedure for obtaining the reduced response involves fitting OHD-RIKES signals in the 1.5 to 10 ps time range by the empirical decay function

$$r(t) = A_1 exp\left(-\frac{t}{\tau_1}\right) + A_2 exp\left(-\frac{t}{\tau_2}\right) + B$$
(S1)

where the  $\tau_1$ -terms are sub-picosecond components, the  $\tau_2$ -term is a picosecond component, and *B* is a constant that accounts for components in the reorientational dynamics relaxing on a time scale much longer than the time-range of the measurements. The solid lines in Figure 2 are fits of eq 1 with fit parameters for CS<sub>2</sub>/IL mixtures tabulated in Table S1. The dashed lines represent the slow contribution to the decays associated with  $\tau_3$ -term and the constant *B*. Fit parameters for the OHD-RIKES signals of the other mixtures are given in Table S1.

Table S1. OHD-RIKES decay parameters for CS<sub>2</sub>/IL liquid mixtures.<sup>a-c</sup>

<sup>a</sup>See eq S1 for definitions of fit parameters; fit range 1.5-10 ps. <sup>b</sup>Errors in fit parameters are less than 6%. <sup>c</sup>The imidazolium ring concentration is same in 10 mol.% monocationic ILs (MIL(n)) solutions and 18.2 mol.% in dicationic ILs (DIL(2n)) solutions.

### IV. RSDs and Fits of the Additivity Model to the RSDs

By convoluting the part of the decay given by  $\tau_2$ -term and the constant *B* with the pulse intensity autocorrelation, a reorientational response is generated which is then subtracted from the OHD-RIKES signal to yield the reduced response comprising only the electronic and the sub-picosecond nuclear responses. By applying the Fourier-transform-deconvolution procedure to the reduced response, the RSD corresponding to the part of the OKE spectrum associated with intramolecular and subpicosecond intermolecular modes of the liquid is obtained.<sup>8,9</sup> Application of a window function<sup>10</sup> reduces the noise in the low-frequency band in the 0-200 cm<sup>-1</sup> region of the RSD without affecting its line-shape. Figures S3a-c show the RSDs and fits of the RSDs to the additivity model (eqs 3-7) for 10-25 mol.% CS<sub>2</sub>/[C<sub>3</sub>C<sub>1</sub>im][NTf<sub>2</sub>], CS<sub>2</sub>/[C<sub>4</sub>C<sub>1</sub>im][NTf<sub>2</sub>], and CS<sub>2</sub>/[C<sub>5</sub>C<sub>1</sub>im][NTf<sub>2</sub>] mixtures. Figures S4a-c show the RSDs and fits of the RSDs to the additivity model for 18.2-40 mol.% CS<sub>2</sub>/[(C<sub>1</sub>im)<sub>2</sub>C<sub>6</sub>][NTf<sub>2</sub>]<sub>2</sub>, CS<sub>2</sub>/[(C<sub>1</sub>im)<sub>2</sub>C<sub>8</sub>][NTf<sub>2</sub>]<sub>2</sub>, and CS<sub>2</sub>/[(C<sub>1</sub>im)<sub>2</sub>C<sub>10</sub>][NTf<sub>2</sub>]<sub>2</sub> mixtures. Fit parameters for the Bucaro-Litovitz (BL) and antisymmetrized Gaussian (AG) line-shape functions (eqs 6 and 7) are given Tables S2a-c.
