## Supplementary Methods

## MM/3D-RISM Calculation

The 3D-RISM calculations have been carried out via two steps. In the first step, bulk solvent (containing water and salt ions) properties has been estimated in one dimension with the aid of 1D-RISM based on the dielectrically consistent RISM (DRISM) theory ${ }^{1}$. This gives the bulk solvent site-site pair correlation and produces the intramolecular matrix in reciprocal space, $\chi^{\mathrm{vv}}(\mathrm{k})$. In the second step, with the results from 1DRISM, solute-solvent correlation function will be subsequently calculated via 3D-RISM method ${ }^{2-4}$. In this work, 3D-RISM calculations have been performed using rism1d and rism3d.snglpnt routine implemented within AmberTools 16. The Kovalenko-Hirata ( KH ) closure ${ }^{5}$ has been applicable to the mixture liquid and utilized for the RISM calculations. For solvent calculation, TIP3P water model ${ }^{6}$ and Joung-Cheatham LJ parameters ${ }^{7}$ are adopted for $\mathrm{Na}+$ and $\mathrm{Cl}-(0.15 \mathrm{M} \mathrm{NaCl}$ concentration $)$. The temperature is set to 298 K , and the dielectric constant of bulk water is set as 78.497 . The non-polar part of solvation is computed by
 degrees of the freedom of solvent molecules, keeping the orientation of the solute macromolecule described at the three-dimensional level. It is to be noted that the chemical potential calculated with the DRISM method is approximate ${ }^{8}$. Considering MM/3D-RISM calculation is computationally demanding, only 100 snapshots sampled from the last 100 ns trajectories are utilized for the calculation of binding free energies. Considering that the MM/3D-RISM method was more computationally demanding, only 100 snapshots from the last 100 ns trajectory of simulation were sampled to calculate the binding free energy. The energy was computed via the equation for each frame:

$$
\begin{equation*}
\Delta \mathrm{G}_{\text {calc }}=\Delta \mathrm{E}_{\mathrm{MM}}+\Delta \mathrm{G}_{\text {solvation }} \tag{2}
\end{equation*}
$$

In Equation (2), $\Delta \mathrm{Emm}_{\text {m }}=\Delta \mathrm{E}_{\mathrm{vdW}}+\Delta \mathrm{E}_{\text {eel }}$ and $\Delta \mathrm{G}_{\text {solvation }}=\Delta \mathrm{G}_{\text {pol }}+\Delta \mathrm{G}_{\text {apol }} . \Delta \mathrm{Emm}$ was the change in the gasphase interaction energy on ligand binding. $\Delta \mathrm{E}_{\mathrm{vd}}$ and $\Delta \mathrm{E}_{\text {eel }}$ were the change in van der Waals interactions and electrostatics energy on ligand binding, respectively. $\Delta \mathrm{G}_{\text {pol }}$ and $\Delta \mathrm{G}_{\text {apol }}$ were the change in polar and non-polar part of solvation free energy as a result of ligand binding to the protein.

## Supplementary Tables

Table S1. The calculated and experimental binding free energies of six studied complexes ( $\Delta \mathrm{G}$ is in $\mathrm{kcal} / \mathrm{mol}$ and $K_{i}$ is in nM$)$.

| Complexes | Calculated values |  |  |  |  |  | Experimental values |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\Delta \mathrm{E}_{\text {ele }}$ | $\Delta \mathrm{E}_{\mathrm{vdW}}$ | $\Delta \mathrm{G}_{\mathrm{pol}}$ | $\Delta \mathrm{G}_{\text {apol }}$ | $\Delta \mathrm{G}_{\text {MM/GBSA }}{ }^{\text {a }}$ | $\Delta \Delta \mathrm{G}_{\mathrm{MM} / \mathrm{GBSA}}{ }^{b}$ | $\Delta \mathrm{G}_{\exp }{ }^{c}$ | $\Delta \Delta \mathrm{G}_{\text {exp }}{ }^{b}$ | $K_{i}{ }^{d}$ |
| Talopram-hNET | $-24.52 \pm 0.10$ | $-52.13 \pm 0.11$ | $25.48 \pm 0.09$ | $-5.82 \pm 0.01$ | $-56.99 \pm 0.11$ | -6.90 | -10.64 | -4.74 | 16 |

${ }^{a} \Delta \mathrm{G}_{\text {s.c. }}$ indicates the energy contribution of the side chains to the ligands binding to hNET.
${ }^{b} \Delta \mathrm{G}_{\text {b.b. }}$ refers to the energy contribution of the backbones to the ligands binding to hNET.
${ }^{\mathrm{c}} \Delta \mathrm{G}_{\text {total }}$ means the total energy contribution of side chains and backbones to ligands binding to hNET.

Table S9. The binding free energy contributions from the backbones (b.b.) and side chains (s.c.) of the residues around the P1 ~ P4 of ligands among the 3 systems including escitalopram-hSERT, ligand10hSERT and talopram-hSERT ( $\Delta \mathrm{G}$ is in $\mathrm{kcal} / \mathrm{mol}$ ).

| P1-P4 | Systems | Escitalopram-hSERT |  |  | Ligand10-hSERT |  |  | Talopram-hSERT |  |  |

${ }^{a} \Delta \mathrm{G}$. .c. indicates the energy contribution of the side chains to the ligands binding to hSERT.
${ }^{b} \Delta \mathrm{G}_{\mathrm{b} . \mathrm{b} \text {. refers }}$ to the energy contribution of the backbones to the ligands binding to hSERT.
${ }^{c} \Delta \mathrm{G}_{\text {total }}$ means the total energy contribution of side chains and backbones to ligands binding to hSERT.
${ }^{d}$ NA. Due to the long distance between F335 and P2 of talopram.

## Supplementary Figures

Figure S1. The visualization of sequence alignment result between target hNET (Entry code: P23975 ${ }^{9}$, from Q54 to N596) and template hSERT (PDB entry: 5I71 ${ }^{10}$, from G77 to T616) via ESPript ${ }^{11}$. Sequence alignment was performed in ClustalX ${ }^{12}$. The 12 transmembrane (TM1-12) domains were marked in purple or light purple color on sequence, and the TM1, 3, 6, 8 and 10 were stressed in purple color. The calculated sequence identity between hNET and hSERT was $54 \%$. The residues colored in red and yellow represent fully identical and very similar, respectively.

- $93.1 \%(501 / 538)$ of all residues were in favored (98\%) regions.
- $98.0 \%(527 / 538)$ of all residues were in allowed ( $>99.8 \%$ ) regions
- There were 11 outliers (phi, psi): 78P ( $-124.4,159.1$ ), 150V ( $-65.6,-120.0$ ), 151W $(-0.8,-24.6), 154 \mathrm{I}(-58.1,-136.8), 155 \mathrm{C}(-66.7,92.1), 211 \mathrm{P}(-54.6$, $-178.4), 250 \mathrm{~L}(-101.6,-148.8), 392 \mathrm{~V}(64.7,-170.2), 400 \mathrm{E}(-60.0,-85.2), 453 \mathrm{D}(-71.7,-116.6), 454 \mathrm{~F}(-65.2,20.6)$

Figure S2. MolProbity Ramachandran analysis of the modeled hNET structure. $93.1 \%$ of all the residues were located in favored regions and $98.0 \%$ of all the residues were in allowed regions.

Figure S3. Structural superimposition of the modeled hNET (in blue cartoon) and the modified hSERT crystal structure (in cyan cartoon). Both hNET and hSERT covered the 12 transmemebrane helixes (TM112) domains, intracellular and extracellular loops. The three parts in red dashed boxes indicated the subtle displacements between hNET and hSERT.

Figure S4. The RMSD values ( $\AA$ ) of protein (in cyan), ligand (in red), binding site (around ligands < $6.0 \AA$ ) (in green), transmembrane domains (TM1-12) (in purple), loop regions (in blue) and TM1, 3, 6, 8 and 10 (in light blue) of the six studied complexes against simulation time (ns) with respect to the corresponding initial structure.

Figure S5. The superimposition of the representative snapshots and the initial poses of the 6 systems. A)C) shown the comparison of the conformations of escitalopram, $\mathbf{1 0}$ and talopram binding to hNET and the conformations of proteins before (ligands in grey stick and hNET in grey cartoon) and after (escitalopram in dark stick, ligand10 in orange stick, talopram in green stick and hNET in blue cartoon) MD simulations. $\left.\mathrm{A}^{\prime}\right)$ - $\mathrm{C}^{\prime}$ ) shown the comparison of the conformations of escitalopram, ligand 10 and talopram binding to hSERT and the conformations of proteins before (ligands in grey stick and hSERT in grey cartoon) and after (escitalopram in dark stick, ligand10 in orange stick, talopram in green stick and hNET in cyan cartoon) MD simulations. The binding sites of hNET and hSERT were marked by ligands in surface and circled by the dashed lines. The residue names and their transmembrane domains were labeled on the corresponding sites. The salt bridges between the residues (D75 in hNET and D98 in hSERT) and the positively charged amine groups were displayed in red dotted.

Figure S6. The binding free energies calculated based on different simulation windows (100-200 ns, 200 $-300 \mathrm{~ns}, 300-400 \mathrm{~ns}$, and $400-500 \mathrm{~ns}, 1000$ snapshots) during the whole 500 ns simulation.

Figure S7. The correlation coefficient $\left(\mathrm{R}^{2}\right)$ between the calculated and experimental values ( $\Delta \Delta \mathrm{G}$ ) using TI method.

Figure S8. The correlation coefficient $\left(\mathrm{R}^{2}\right)$ between the difference of the calculated and experimental values ( $\Delta \Delta \mathrm{G}$ ) using MM/3D-RISM method.
