Table of Contents:

- 1. C1s and O1s XPS spectra of graphene oxide (GO), rGO1 (microwave-hydrothermal reduced GO) and rGO2 (thermally annealed GO)
- 2. Combustion Elemental Analysis for GO, rGO1 and rGO2
- 3. Representative high performance liquid chromatography (HPLC) spectra for the combinations used in this study.
- 4. Product distribution table in wt% yields
- 5. Glucose production from cellulose by various carbon materials
- 6. Spent rGO2 characterization (FTIR, XRD and XPS)
- 7. Particle size analysis of oligosaccharides

1. C1s and O1s XPS spectra of graphene oxide (GO), rGO1 (microwave-hydrothermal reduced GO) and rGO2 (thermally annealed GO)

Fig. S1. X-ray photoelectron spectroscopy for graphene oxide (GO), microwave reduced graphene oxide (rGO1) and thermally annealed graphene oxide (rGO2).

	C%	H%	N%	S%	C/O
GO	44.1	2.06	0.43	1.96	0.86
rGO1	75.34	0.51	0.33	0	3.16
rGO2	71.78	0.50	0.48	0	2.64

2. Table S1. Combustion Elemental Analysis data

# 3. Representative HPLC spectra

Fig. S2. Representative high performance liquid chromatography (HPLC) spectra for the combinations used in this study.

# 4. Table S2: Product distribution table in wt% yields

*Ch* : conventional heating; MW : microwave irradiation; rGO1 : microwave - reduced graphene oxide; rGO2 : thermally annealed reduced graphene oxide; CNT : carbon nanotubes; Gr: graphite Conditions: cellulose 200 mg, rGO 1 and 2 200 mg, 10 ml distilled water, 200 W, holding time 5 min

# 5. Glucose production from cellulose by various carbon materials

In this summary, only carbon materials which served as main catalyst has been considered. Those carbon materials that acted as support or scaffold has been excluded.

Entry	Catalyst	Substrate	Intensification technique	Reaction temperature	Reaction time	Yield	Reference	
1	Reduced graphene oxide	Microcrystalline cellulose	Microwave irradiation (200 W)	240 <sup>o</sup> C	5 min	66%	This method	
2	Graphene oxide	Microcrystalline cellulose	Microwave irradiation (200 W)	180 <sup>0</sup> C	60 min	61%	Mission et al., 2017	
3	Air oxidized cellulose + HCl	Woody biomass (Eucalyptus)	Mix-milling (2h)	Heating 488 K then lowered to 298 K	1 h	78-82%	Kobayashi et al., 2016	
4	Sulfonated Magnetic Carbonaceous acid (Pyrolyzed glucose and magnetic Fe3O4 nanoparticles)	Ball-milled cellulose	Microwave irradiation	190 <sup>o</sup> C	3.5 h	25.3%	Su et al., 2015	
5	Sucralose- derived solid acid catalyst with –Cl and – SO3H functionalities	Microcrystalline cellulose	lonic liquids	120 °C	24 h	55%	Hu et al., 2014	
6	Sulfonated activated carbon	Ball-milled cellulose	-	423 K	24 h	41.4	Onda et al., 2009	
7	Sulfonated Magnetic reduced graphene oxide (Fe3O4- RGO-SO3H)	Microcrystalline cellulose	-	150 <sup>0</sup> C	5 h	28%	Yang et al., 2015	
8	Biomass char sulfonic acid (BC-SO3H)	Microcrystalline cellulose	Microwave irradiation (350 W)	90 <sup>0</sup> C	1 h	16.7	Wu et al., 2009	
9	Amorphous carbon + SO3H+ COOH + OH	Microcrystalline cellulose	-	373 K	3h	4% + 64% β 1,4 glucan	Suganuma et al	
10	Activated carbon + HCI	Microcrystalline cellulose	Mix milled	453 K	1 h	88%	Kobayashi et al.`	

 Table S3: Summary of glucose production from cellulose by various carbon materials

#### 6. Spent rGO2 characterization

Figure S3. Catalyst reuse scheme

Figure S4. Fourier transform infrared spectra (FTIR, left) and X-ray diffractograms (XRD, right) spectra of rGO2 utilized in several cycles: CYC1 – first cycle, pure fresh rGO2; CYC2 – 50% residue from CYC1 and 50% fresh rGO2; CYC 3 – 50% residue from CYC2 and 50% fresh rGO2

Sample	Eleme Compo (%)	ntal osition	C1s D	econvol	ution					O1s Deconvolution				tion	
Code	С	0	C=C-I	⊣ <sup>C=C</sup> sp²	C-H	C-C sp³	C-OH	C-O-C	C=O	0=C-0	п•π*	Quinone	eC=O	0-C-0	C-OH
CYC1	65.9	34.1	-	66.6	-	-	17.1	7.5	-	5.7	3.1	8.8	3.1	64.4	23.7
CYC2	79.1	20.9	-	56.51	-	-	23.41	-	15.68	-	4.40	4.34	1.64	5.11	88.92

Energy binding (eV)

Energy binding (eV)

Fig. S5. X-ray photoelectron spectroscopy of rGO2 utilized in several cycles: CYC1 – first cycle, pure fresh rGO2; CYC2 – 50% residue from CYC1 and 50% fresh rGO2; CYC 3 - 50% residue from CYC2 and 50% fresh rGO2

#### 7. Particle size analysis of oligosaccharides

In the proposed reaction mechanism, it was suggested that  $\beta$ -glucans or oligosaccharides could be trapped in between the nanopores and nanovoids of the rGO2 which could have facilitated faster hydrolysis reaction. In order to support this suggestion, we have measured the particle size of cellobiose, which is the most detected oligosaccharides or  $\beta$ -glucans, as per HPLC analysis.

We have prepared a solution of cellobiose and measured the particle size using dynamic light scattering technique (DLS; Zetasizer Nano ZS Malvern Instruments, Ltd. UK). A representative histogram distribution of the particle size measurement is shown below (Fig. S5), and we found out that the range of cellobiose particle size is 0.6 to 5560 nm with an average of 56 nm. With nanopore average of about 28 nm, it is possible that cellobiose having particle size at the lower segment of the distribution could be trapped into the nanovoids as suggested.
