Table of Contents

1. Experimental section for X-ray crystallography
2. Crystal table
3. UV-vis spectra of **1**, **2**, and **9**
4. Job's plot of **1** and Hg²⁺ ion
5. MALDI data of **1**, **2** and HR-MS spectra of **1**, **2** in the presence of Hg²⁺ ion
6. PL data of **2**, **2** in the presence of Hg⁺ ion, and (ppy)₂Ir(CH₃CN)₂
7. Comparison of NMR spectra
8. Comparison of ECL intensity
9. ECL spectra of **1** and **2**
10. CV voltammograms of **1**, **2**, and **9**
11. NMR copies of **1**, **2**, **9** in DMSO-*d*₆ and **5** in CD₃CN.

X-ray Diffraction Studies

Experimental

Single crystals ($\text{C}_{26}\text{H}_{22}\text{IrN}_4$ [(ppy) $_2\text{Ir}(\text{CH}_3\text{CN})_2$]) for X-ray diffraction were obtained by vapor diffusion of water into a concentrated solution of **2** in the presence of 0.5 equivalent of $\text{Hg}(\text{NO}_3)_2$ in acetonitrile. A suitable crystal was selected onto a nylon loop with Paratone[®] N oil and mounted on Agilent SuperNova, Dual, Cu at home/near, AtlasS2 diffractometer. The crystal was kept at 293.0(4) K during data collection using Cu K α radiation ($\lambda = 1.542 \text{ \AA}$). A total number of 10459 reflections were measured ($6.078^\circ \leq 2\theta \leq 147.946^\circ$) with 1° steps (ω scan). The structure was solved with *ShelXT* software using direct methods and refined using least squares minimization refinement package of OLEX2. CCDC 1576742 contains the supplementary crystallographic data of this paper. These data can be obtained free of charge from the Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif.
