## Analysis for DOSY NMR

Einstein–Stokes equation

$$D = \frac{kT}{6\pi\eta R_H} \rightarrow R_H = \frac{6\pi \cdot \eta}{kT} \cdot \frac{\eta}{D}$$

$D$ : Diffusion constant,  $k$ : Boltzmann's constant,  $T$ : Absolute temperature,  $\eta$ : Viscosity of the medium,  $R_H$ : Hydrodynamic radius

Ratio of hydrodynamic radius  $\frac{R_H(\text{Pt} \cdot \text{Cl})}{R_H(\text{Pt} \cdot \text{B}(\text{C}_6\text{F}_5)_4)} = \frac{D(\text{Pt} \cdot \text{B}(\text{C}_6\text{F}_5)_4)}{D(\text{Pt} \cdot \text{Cl})} = 1.29$

Ratio of hydrodynamic volume  $\frac{V(\text{Pt} \cdot \text{Cl})}{V(\text{Pt} \cdot \text{B}(\text{C}_6\text{F}_5)_4)} = 1.29^3 \approx 2.2$
