## General Procedure for the Preparation of Copper Complexes of the ASC Ligands

To a hot methanolic (5 mL) solution of the ASC ligand (1 mmol), copper chloride dihydrate (179 mg, 1.05 mmol) was added and refluxed for 2 h. The precipitate formed was cooled to room temperature and collected by vacuum filtration, washed with diethyl ether and dried in air.

### General Procedure for the Preparation of Iron Complexes of the ASC and ABH Ligands

The ligand (0.5 mmol; except for **10**) was dissolved in ethanol (10 mL) with heating. If not completely soluble, a few millilitres of acetonitrile was added to completely dissolve the ligands. Ferric perchlorate hexahydrate (115 mg, 0.25 mmol) was added and refluxed for 1 h. The solution was concentrated and poured into diethyl ether to precipitate the product, which was filtered, washed with adequate amounts of diethyl ether and dried in air.

As described previously, the Fe<sup>II</sup> complex of **10** was prepared by an alternative procedure due to the inability to isolate a pure complex by the method above and because of the known preference of pyridine-derived hydrazones to form Fe<sup>II</sup> complexes.<sup>1</sup> Briefly, **10** (0.25 mmol) was suspended in acetonitrile (10 mL) and triethylamine (5 mmol) was added. The resulting solution was degassed under nitrogen. Ferrous perchlorate hexahydrate (45 mg, 0.12 mmol) dissolved in degassed acetonitrile (5 mL) was added drop wise to the ligand solution under reflux and the reaction mixture was refluxed for 3 h. The precipitate formed was collected by filtration, washed with methanol and air dried.

**Figure S6.** Linear relationship between the experimental and reported effective permeability coefficients ( $P_e$ ) determined by PAMPA-BBB.  $P_e(\text{exp}) = 1.0563 P_e(\text{ref}) + 1.3528$ . Results are presented as the mean of quadruplicate repeats examined in  $\geq 3$  experiments.

**Table S1.** Effective permeability coefficients ( $P_e$ ) of reference agents used for the validation of the PAMPA-BBB experiment.

Reference Agent	$P_e$ ( $10^{-6}$ cm s $^{-1}$ )	
	Reference value	Experimental value
Theophylline	0.1 <sup>2</sup>	2.63 ± 0.05
Verapamil	16 <sup>2</sup>	18.42 ± 3.04
Progesterone	9.3 <sup>2</sup>	9.36 ± 1.00
Chlorpromazine	6.5 <sup>2</sup>	6.69 ± 0.53
Donepezil	12 <sup>3</sup>	16.04 ± 4.20

**Table S2.** Classification of effective permeability coefficients ( $P_e$ ) determined by the PAMPA-BBB ( $P_e$ ,  $10^{-6}$  cm s $^{-1}$ ).<sup>4</sup>

Compounds with predicted high BBB permeation (CNS+)	$P_e > 5.578$
Compounds with uncertain BBB permeation (CNS+/-)	$5.578 > P_e > 3.46$
Compounds with predicted low BBB permeation (CNS-)	$P_e < 3.46$
