## S1 General considerations

All reagents were obtained from commercial sources, i.e. Sigma-Aldrich, Merck and Rochelle Chemicals and used as received. $\mathrm{Mn}(\mathrm{OTf})_{2}$ was stored in a glove box (MBraun) under an Ar atmosphere. Solvents employed in complex synthesis, $\mathrm{Et}_{2} \mathrm{O}$ and DCM , were freshly distilled under a $\mathrm{N}_{2}$ atmosphere using $\mathrm{Na} /$ benzophenone and $\mathrm{CaH}_{2}$, respectively. Catalytic experiments were conducted with $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$, containing an inhibitor to prevent disproportionation, and stored in a refrigerator when not in use. FT-IR spectra were documented on a BrukerAlpha-P range infrared instrument equipped with an ATR accessory as neat samples in the range of $400 \mathrm{~cm}^{-1}$ to $4000 \mathrm{~cm}^{-1} .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR spectra were recorded on a Bruker Ultrashield Plus ( 600 MHz and 151 MHz , respectively) in 5 mm cylindrical glass tubes. APCI-MS analysis was done on a BrukermicroTOF-Q II mass spectrometer. Magnetic susceptibility measurements were conducted using a Sherwood Scientific MK1 with 4 mm in diameter sample tubes containing 50 mM samples in acetonitrile. Elemental analysis was carried by the University of KwaZulu-Natal (UKZN) Mass Spectrometry Laboratory. Gas chromatographic analysis (GC and GC-MS) were performed on an Agilent 6890 Series GC System with a HP 5 column, 30 m in length, 0.320 mm internal diameter and 0.25 mm film thickness. Rinsing solutions included MeCN (GC) or MeOH and DCM (GC-MS) with $\mathrm{N}_{2}$ (GC) or He (GC-MS) serving as the carrier gas and biphenyl as an internal standard.

## S2 Synthesis of non-heme $\mathbf{N}_{4}$-tetradentate ligands, $R, R$ - and S,S-L1 - L4

The resolution of the 1,2-diaminocyclohexane tartrate salt was done according to a previously reported method. ${ }^{1-2}$ Chiral ligands, and R,R- and S,S-L1 - L4 were prepared according to a modified literature procedure. ${ }^{3}$

N,N'-dimethyl-N,N'-bis(2-pyridylmethyl)-(R,R)-1,2-diaminocyclohexane (R,R-BPMCN) ( $R, R$-L1)

Scheme S1: Synthesis of ligand R,R-BPMCN (R,R-L1).
$R, R$-BPMCN-Imine: In a beaker the $R, R$-DACH salt ( $346 \mathrm{mg}, 1.309 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}(360$ $\mathrm{mg}, 2.605 \mathrm{mmol}$ ) was dissolved in water ( 3 ml ) which was added to a 100 ml round bottom flask after complete dissolution. Ethanol ( 5 ml ) was added to the solution. The solution was heated almost to reflux during which 2-pyridinecarboxaldehyde ( $275 \mathrm{mg}, 2.567 \mathrm{mmol}$ ), dissolved in 5 ml of ethanol, was added to the solution. The reaction mixture was refluxed for 6 hours after which 3 ml of water was added. The solution was then cooled down in an ice bath for 30 min . The water layer was extracted with DCM ( $3 \times 5 \mathrm{ml}$ portions) after which the organic layer was washed with water ( $2 \times 5 \mathrm{ml}$ portions) and saturated NaCl solution ( $1 \times 5$ ml portion). The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent removed. Diethyl ether ( $\mathrm{Et}_{2} \mathrm{O}$ ) was added until the entire product dissolved. The solvent was reduced to 10 ml and left overnight in the freezer. The product was isolated as a light yellow crystalline solid ( 226 $\mathrm{mg}, 60 \%$ yield). FT-IR (ATR) v, $\mathrm{cm}^{-1}: 3061,3008,2928,2862,1643,1567,1468,775 .{ }^{1} \mathrm{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{ppm}$ ) $\delta: 8.49-8.45(\mathrm{~m}, 2 \mathrm{H}), 8.24(\mathrm{~s}, 2 \mathrm{H}), 7.81(\mathrm{~d}, \mathrm{~J}=7.9 \mathrm{~Hz}, 2 \mathrm{H})$, 7.57 (td, J = 7.7, $1.5 \mathrm{~Hz}, 2 \mathrm{H}$ ), 7.14 (ddd, J = 7.4, $4.8,1.1 \mathrm{~Hz}, 2 \mathrm{H}$ ), 3.46 (dd, J = $6.4,3.4 \mathrm{~Hz}$, 2 H ), 1.78 (ddd, J=18.9, 11.2, $2.2 \mathrm{~Hz}, 6 \mathrm{H}$ ), $1.49-1.39(\mathrm{~m}, 2 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $151 \mathrm{MHz}, \mathrm{CDCl}_{3}$, ppm) $\delta: 161.45,154.63,149.25,136.45,124.48,121.35,73.57,32.74,24.37$.
$\underline{R, R-B P M C N-a m i n e: ~} R, R$-BPMCN-imine ( $206 \mathrm{mg}, 0.7045 \mathrm{mmol}$ ) was dissolved in MeOH ( 3 $\mathrm{ml})$ and placed in an ice bath for $30 \mathrm{~min} .0 .136 \mathrm{~g}(3.595 \mathrm{mmol}) \mathrm{NaBH}_{4}(136 \mathrm{mg}, 3.595 \mathrm{mmol})$ was added portion-wise over a period of 5 min whilst stirring the solution. The resulting solution was further stirred for 1 hour at ambient temperature after which it was refluxed for 1 hour. After the allotted time the solution cooled to room temperature, DCM ( 20 ml ) was added and the organic layer washed with water ( $2 \times 5 \mathrm{ml}$ portions) and saturated NaCl solution ( $1 \times 5 \mathrm{ml}$ portion). The organic layer was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the solvent removed to yield a light yellow oil ( $196 \mathrm{~g} ; 94 \%$ ). $\underline{R, R-L 1: ~ R, R-B P M C N-a m i n e ~(~} 136 \mathrm{mg}, 0.4587 \mathrm{mmol}$ ) was dissolved in MeCN ( 5 ml ). Whilst stirring, $35 \%$ formaldehyde ( $436 \mathrm{mg}, 5.082 \mathrm{mmol}$ ) and glacial acetic acid ( 0.75 ml ) was added to the solution. The solution was stirred for 30 min after which $\mathrm{NaBH}_{4}(73 \mathrm{mg}, 1.923$ mmol ) was added portion wise. The reaction mixture was stirred for 72 hours at ambient temperature where after the MeCN was removed in vacuo. $\mathrm{KOH}(2 \mathrm{M})$ was added to the oily residue to raise the pH of the solution above 10. The resulting aqueous solution was
extracted with DCM ( $3 \times 10 \mathrm{ml}$ portions), separated and the organic layer washed with $\mathrm{H}_{2} \mathrm{O}$ ( $2 \times 10 \mathrm{ml}$ portions) and saturated NaCl solution ( $1 \times 10 \mathrm{ml}$ portion). ## S6 Evaluating primary and secondary alcohol oxidation with $R, R$ - and S,S-C4

Complex $\boldsymbol{R}, \boldsymbol{R}$ - or $\mathbf{S}, \mathbf{S}-\mathbf{C 4}$ ( $0.5 \mathrm{~mol} \%$ ) was dissolved in MeCN ( 2.395 ml ) using an alcohol substrate ( 0.8 mmol ) and AcOH ( 10 equivalents, 0.460 ml ). After filtering through a silica plug, the mixture was analysed by GC and GC-MS. All runs were performed in duplicate.

To obtain the isolated products after the oxidation reaction, a saturated sodium hydrogen carbonate $\left(\mathrm{NaHCO}_{3}\right)$ solution ( 3 ml ) was slowly added to the reaction mixture until the bubbling ceased. DCM ( 10 ml ) was added and separation of the aqueous and organic layers was done. Extraction of the remaining aqueous layer with DCM ( $2 \times 10 \mathrm{ml}$ ) was performed where after all the organic layers were combined and dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After filtration the solvent was allowed to dry in open air.
