Figure S1: Inclined Board Test results in offspring of dams fed during pregnancy a standard diet or a diet rich in advanced glycation end products

CTRL offspring of dams consuming during pregnancy a control diet, n=18; AGE-RD: offspring of dams consuming during pregnancy advanced glycation end products-rich diet (25% bread crusts/75% standard chow; w/w), n=13. Animal was placed on a polystyrene board, which was gradually elevated by 5 degrees. The maximum angle (x-axis= slope) at which the animal could maintain its position on the inclined board for 5 sec. was recorded. Test was evaluated using repeated measures ANOVA; mean angles in each time point are given; significance: performance over time: $p < 0.001$; between group performance: $p = 0.401$
