

Fig S1 Pathological examination of hepatic tissue slices from experimental BALB/c mice.

The mice were euthanized after a feeding period of four weeks. The liver and kidney were removed immediately and weighed. Then, the left lobes, kidney and small intestine were dehydrated, embedded in paraffin, sliced, hematoxylin–eosin stained and photographed with an optical microscope (Nikon DS-Qi2). A. Liver. B. Kidney.

Fig S2 Rarefaction curves. Rarefaction curves were calculated at 3% distance with pyrosequencing data in microbiota from groups of PLA04 and PBS

Fig. S3 Alpha diversity (ACE, chao1, goods coverage, observed species, PD whole tree, shannon and simpson) of the gut microbiota in the seven groups

Fig. S4 Significant difference of microbiota between PLA04 and other Lactobacilli using Metastats analysis at the family level. BALB/c mice were gavaged with PBS or strains (1×10^9 CFU) for 4 weeks ($n = 6$ in the PBS and PLA04 groups, $n = 4$ in the control, PLA01, BUL, CAS, and LGG groups, respectively): * p value of < 0.05

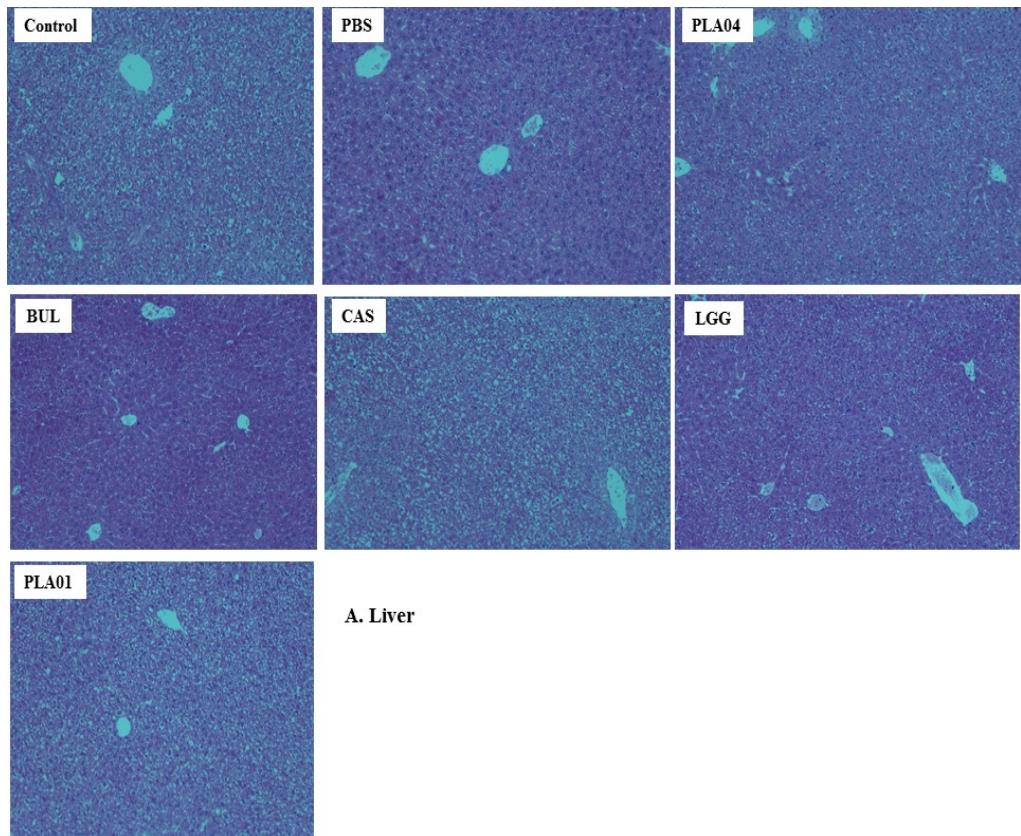

Fig. S5 Significant difference of microbiota between PLA04 and other Lactobacilli using Metastats analysis at the genus level. BALB/c mice were gavaged with PBS or strains (1×10^9 CFU) for 4 weeks ($n = 6$ in the PBS and PLA04 groups, $n = 4$ in the control, PLA01, BUL, CAS, and LGG groups, respectively): * p value of < 0.05

Fig. S6 Significant difference of microbiota between PLA04 and other Lactobacilli using Metastats analysis at the phylum level. BALB/c mice were gavaged with PBS or strains (1×10^9 CFU) for 4 weeks ($n = 6$ in the PBS and PLA04 groups, $n = 4$ in the control, PLA01, BUL, CAS, and LGG groups, respectively): * p value of < 0.05
