[Ref. 2] M.L. Cable, J.P. Kirby, K. Sorasaenee, H.B. Gray and A, Ponce, J. Am. Chem. Soc., 2007, 129, 1474-1475.
[Ref. 3] C.A.Chang, H.Y. Lee and Ch.-L. Chen, Dalton Trans., 2013, 42, 6397-6409.

Generally, the number of water molecules coordinated to $\mathrm{Eu}(\mathrm{III})$ complex was estimated by simplified equation [ref. 1] as

$$
\begin{equation*}
q_{\mathrm{H}_{2} \mathrm{O}-\mathrm{EuL}}=1.05 \times k_{\mathrm{H}_{2} \mathrm{O}}-0.70 \tag{S1}
\end{equation*}
$$

and/or other form was obtained after rearrangement

$$
\begin{equation*}
k_{\mathrm{H}_{2} \mathrm{O}-\mathrm{EuL}}=\frac{q_{\mathrm{H}_{2} \mathrm{O}-\mathrm{EuL}}+0.70}{1.05} \tag{S2}
\end{equation*}
$$

The equilibrium constant for the following reaction at given pH

$$
\begin{equation*}
\left[\mathrm{Eu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{9}\right]^{3+}+\mathrm{L} \stackrel{K_{\text {eff.fut }}}{\longleftrightarrow}\left[\operatorname{EuL}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}\right]^{+}+6 \mathrm{H}_{2} \mathrm{O} \tag{Eq_A}
\end{equation*}
$$

is defined as

$$
\begin{equation*}
K_{\text {eff }, \text { EuL }}=\frac{[\mathrm{EuL}]}{[\mathrm{Eu}] \times[\mathrm{L}]} \tag{S3}
\end{equation*}
$$

and the mass-balance equations are valid

$$
\begin{align*}
& c_{\mathrm{Eu}}=[\mathrm{EuL}]+[\mathrm{Eu}]  \tag{S4A}\\
& c_{\mathrm{L}}=[\mathrm{EuL}]+[\mathrm{L}] \tag{S4B}
\end{align*}
$$

The following equation related to rate constant of luminescence decay of $\mathrm{Eu}(\mathrm{III})$ complex in presence of free $\mathrm{Eu}(\mathrm{III})$ ion was derived elsewhere [ref. 1]

$$
\begin{equation*}
k_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}-\mathrm{Eu}}=k_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}} \times \delta_{\mathrm{EuL}}+k_{\mathrm{H}_{2} \mathrm{O}, \mathrm{Eu}} \times\left(1-\delta_{\mathrm{EuL}}\right) \tag{S5}
\end{equation*}
$$

where the relative concentration of $\mathrm{Eu}(\mathrm{III})$ complex is $\delta_{\mathrm{EuL}}=\frac{[\mathrm{EuL}]}{\mathrm{c}_{\mathrm{Eu}}}$
Combining Eqs (S3) and (S4A and S4B), the following equation is derived

$$
\begin{equation*}
K_{\mathrm{eff}, \mathrm{EuL}}=\frac{[\mathrm{EuL}]}{[\mathrm{Eu}] \times[\mathrm{L}]}=\frac{\delta_{\mathrm{EuL}} \times c_{\mathrm{Eu}}}{\left(1-\delta_{\mathrm{EuL}}\right) \times c_{\mathrm{Eu}} \times\left(c_{\mathrm{L}}-\delta_{\mathrm{EuL}} \times \mathrm{c}_{\mathrm{Eu}}\right)}=\frac{\delta_{\mathrm{EuL}}}{\left(1-\delta_{\mathrm{EuL}}\right) \times\left(c_{\mathrm{L}}-\delta_{\mathrm{EuL}} \times \mathrm{c}_{\mathrm{Eu}}\right)} \tag{S6}
\end{equation*}
$$

Substituting Eq. (S5) by Eq. (S2)

$$
\begin{equation*}
\frac{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}-\mathrm{Eu}}+0.70}{1.05}=\frac{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}}+0.70}{1.05} \times \delta_{\mathrm{EuL}}+\frac{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{Eu}}+0.70}{1.05} \times\left(1-\delta_{\mathrm{EuL}}\right) \tag{S7}
\end{equation*}
$$

and the new Equation is obtained after arrangement:

$$
\begin{equation*}
q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}-\mathrm{Eu}}=q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}} \times \delta_{\mathrm{EuL}}+q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{Eu}} \times\left(1-\delta_{\mathrm{EuL}}\right) \tag{S8}
\end{equation*}
$$

Thus, the relative concentration of $\mathrm{Eu}($ III $)$ complex can be calculated as

$$
\begin{equation*}
\delta_{\mathrm{EuL}}=\frac{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{Eu}}-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}-\mathrm{Eu}}}{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{Eu}}-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}}} \tag{S9}
\end{equation*}
$$

Assuming the chemical reaction (A), the Eq. (S9) can be simplified as

$$
\begin{equation*}
\delta_{\mathrm{EuL}}=\frac{9-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{EuL}-\mathrm{Eu}}}{6} \tag{S10}
\end{equation*}
$$

and this relationship can be used for calculation of equilibrium constant (see Eq. (S6)). To get stability constant which is independent on pH :

$$
\begin{equation*}
\log \beta_{\mathrm{EuL}}=\log K_{\mathrm{eff}, \mathrm{EuL}}-\log \alpha_{\mathrm{L}(\mathrm{H})} \tag{S11}
\end{equation*}
$$

where the term is calculated as

$$
\begin{equation*}
\alpha_{\mathrm{LH}(\mathrm{H})}=1+K_{\mathrm{p} 1} \times\left[\mathrm{H}^{+}\right]+K_{\mathrm{p} 1} \times K_{\mathrm{p} 2} \times\left[\mathrm{H}^{+}\right]^{2}+\ldots \tag{S12}
\end{equation*}
$$

Analogously, the equilibrium constant for the following reaction at given pH

$$
\begin{equation*}
\left[\mathrm{Tb}\left(\mathrm{H}_{2} \mathrm{O}\right)_{8}\right]^{3+}+\mathrm{L} \stackrel{K_{\text {effrbu }}}{\longleftrightarrow}\left[\mathrm{TbL}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{+}+6 \mathrm{H}_{2} \mathrm{O} \tag{Eq_B}
\end{equation*}
$$

is defined as

$$
\begin{equation*}
K_{\mathrm{eff}, \mathrm{TbL}}=\frac{[\mathrm{TbL}]}{[\mathrm{Tb}] \times[\mathrm{L}]} \tag{S13}
\end{equation*}
$$

as well as

$$
\begin{equation*}
q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{TbL}-\mathrm{Tb}}=q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{TbL}} \times \delta_{\mathrm{TbL}}+q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{~Tb}} \times\left(1-\delta_{\mathrm{TbL}}\right) \tag{S14}
\end{equation*}
$$

Thus the relative concentration of Tb (III) complex can be calculated as

$$
\begin{equation*}
\delta_{\mathrm{TbL}}=\frac{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{~Tb}}-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{TbL}-\mathrm{Tb}}}{q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{~Tb}}-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{TbL}}} \tag{S15}
\end{equation*}
$$

Assuming the chemical reaction (B), the Eq. (14) can be simplified as

$$
\begin{equation*}
\delta_{\mathrm{TbL}}=\frac{8-q_{\mathrm{H}_{2} \mathrm{O}, \mathrm{TbL}-\mathrm{Tb}}}{6} \tag{S16}
\end{equation*}
$$

and this relationship can be used for calculation of equilibrium constant (see Eq. (S13)).
To get stability constant independent on pH :

$$
\begin{equation*}
\log \beta_{\mathrm{EuL}}=\log K_{\mathrm{eff}, \mathrm{EuL}}-\log \alpha_{\mathrm{L}(\mathrm{H})} \tag{S17}
\end{equation*}
$$

## The formation of $[\mathrm{Eu}(\mathrm{do} 2 \mathrm{a})]^{+}$complex - reaction mechanism

The formation of $\mathrm{Eu}($ III $)$ complex can be described by two-step reaction mechanism (the charges of species are omitted for the sake of clarity):
$\mathrm{Eu}+\mathrm{H}_{x} \mathrm{~L} \stackrel{K^{*}}{\longleftrightarrow}\left[\mathrm{Eu}\left(\mathrm{H}_{y} \mathrm{~L}\right)\right]^{*}+(x-y) \mathrm{H}^{+}$
$\left[\mathrm{Eu}\left(\mathrm{H}_{y} \mathrm{~L}\right)\right]^{*} \xrightarrow{k^{*}}[\mathrm{EuL}]+y \mathrm{H}^{+}$

Generally, the rate of formation of $\mathrm{Eu}(\mathrm{III})$ complex can be described as
$v=k_{2, \mathrm{f}} \times[\mathrm{Eu}]_{\mathrm{tot}} \times[\mathrm{L}]_{\mathrm{tot}}$
For reaction mechanism mentioned above, the rate of formation of $\mathrm{Eu}(\mathrm{III})$ complex is

$$
\begin{equation*}
v=k^{*} \times\left[\mathrm{EuL}^{*}\right] \tag{S19}
\end{equation*}
$$

knowing the equilibrium constant $K^{*}$
$K^{*}=\frac{\left[\mathrm{EuL}^{*}\right]}{[\mathrm{Eu}] \times\left[\mathrm{H}_{x} \mathrm{~L}\right]}$
In metal excess $\left(c_{\mathrm{Eu}} \gg c_{\mathrm{L}}\right)$, the previous equations can be modified as
$v=k^{*} \times \frac{K^{*} \times[\mathrm{Eu}]_{\mathrm{tot}}}{1+K^{*} \times[\mathrm{Eu}]_{\mathrm{tot}}} \times[\mathrm{L}]_{\mathrm{tot}} \Rightarrow k_{\mathrm{f}, \mathrm{obs}}=k^{*} \times \frac{K^{*} \times[\mathrm{Eu}]_{\mathrm{tot}}}{1+K^{*} \times[\mathrm{Eu}]_{\mathrm{tot}}}$
and analogously in ligand excess $\left(c_{\text {Eu }} \ll c_{\mathrm{L}}\right)$
$v=k^{*} \times \frac{K^{*} \times[\mathrm{L}]_{\mathrm{tot}}}{1+K^{*} \times[\mathrm{L}]_{\mathrm{tot}}} \times[\mathrm{Eu}]_{\mathrm{tot}} \Rightarrow k_{\mathrm{f}, \mathrm{obs}}=k^{*} \times \frac{K^{*} \times[\mathrm{L}]_{\mathrm{tot}}}{1+K^{*} \times[\mathrm{L}]_{\mathrm{tot}}}$
It is evident $k_{2, \mathrm{f}}=k^{*} \times K^{*}[\operatorname{Refs} 1,2]$. Also in case when nominator $\approx 1$, then
$k_{\mathrm{f}, \text { obs }}=k^{*} \times K^{*} \times[\mathrm{Eu}]_{\text {tot }}=k_{2, \mathrm{f}} \times[\mathrm{Eu}]_{\text {tot }}\left(c_{\mathrm{Eu}} \gg c_{\mathrm{L}}\right)$
$k_{\mathrm{f}, \text { obs }}=k^{*} \times K^{*} \times[\mathrm{L}]_{\mathrm{tot}}=k_{2, \mathrm{f}} \times[\mathrm{L}]_{\mathrm{tot}} \quad\left(c_{\mathrm{Eu}} \ll c_{\mathrm{L}}\right)$

Fig. S7.: The plot of pseudo-first rate constants of $\mathrm{Eu}(\mathrm{III})$ complex formation as function of europium(III) concentration. The second-order rate constant 0.463 $\mathrm{M}^{-1} \mathrm{~s} .{ }^{-1}$ was obtained as slope linear dependence.

Fig. S8: The distribution diagram of $\mathrm{Eu}(\mathrm{III})-\mathrm{H}_{2} \mathrm{do} 2 \mathrm{a}$ system (kinetic speciation diagram).

## $\underline{\text { Thermodynamics vs. kinetics of }[\operatorname{Ln}(\mathrm{do} 2 \mathrm{a})]^{+} \text {complexes }}$

The consistency of obtained kinetic parameters can be verified by calculation of stability constant of $\operatorname{Ln}($ III $)$ complexes. For the following chemical reaction

$$
\begin{equation*}
\mathrm{LnL}^{+}+\mathrm{H}^{+} \Leftrightarrow \mathrm{Ln}^{3+}+\mathrm{HL}^{-} \tag{Eq_D}
\end{equation*}
$$

the kinetic rate law ii defined as

$$
\begin{equation*}
v=k_{\mathrm{H}} \times[\mathrm{LnL}] \times\left[\mathrm{H}^{+}\right]=k_{\mathrm{HL}} \times[\mathrm{Ln}] \times[\mathrm{HL}] \tag{S24}
\end{equation*}
$$

which can be defined in enlarged form

$$
\begin{equation*}
v=k_{\mathrm{H}} \times \beta_{\mathrm{LnL}} \times[\mathrm{Ln}] \times[\mathrm{L}] \times\left[\mathrm{H}^{+}\right]=k_{\mathrm{HL}} \times[\mathrm{Ln}] \times K_{\mathrm{HL}} \times\left[\mathrm{H}^{+}\right] \times[\mathrm{L}] \tag{S25}
\end{equation*}
$$

where equilibrium constants are defined as

$$
\begin{equation*}
\beta_{\mathrm{LnL}}=\frac{[\mathrm{LnL}]}{[\mathrm{Ln}] \times[\mathrm{L}]} \text { and } K_{\mathrm{HL}}=\frac{[\mathrm{HL}]}{\left[\mathrm{H}^{+}\right] \times[\mathrm{L}]} \tag{S26}
\end{equation*}
$$

Then after simplification

$$
\begin{equation*}
k_{\mathrm{H}} \times \beta_{\mathrm{LnL}}=k_{\mathrm{HL}} \times K_{\mathrm{HL}} \tag{S27}
\end{equation*}
$$

the final relationship is derived

$$
\begin{equation*}
\beta_{\mathrm{LnL}}=\frac{k_{\mathrm{HL}}}{k_{\mathrm{H}}} \times K_{\mathrm{HL}} \tag{S28A}
\end{equation*}
$$

or in logarithmic form as

$$
\begin{equation*}
\log \beta_{\mathrm{LnL}}=\log \left(\frac{k_{\mathrm{HL}}}{k_{\mathrm{H}}}\right)+\log K_{\mathrm{HL}} \tag{S28B}
\end{equation*}
$$

The meaning of rate constants $k_{\mathrm{HL}}$ and $k_{\mathrm{H}}$ defined for the formation and dissociation reaction of $\operatorname{Ln}(\mathrm{III})$ complexes is connected with parameters defined earlier. The overall rate constant for formation of $\operatorname{Ln}$ (III) complex

$$
\mathrm{Ln}^{3+}+\mathrm{HL}^{-} \xrightarrow{k_{\mathrm{HI}}} \mathrm{LnL}+\mathrm{H}^{+}
$$

The dissociation constant of $\operatorname{Ln}(\mathrm{III})$ complex was described by another reaction pathway as

$$
\begin{align*}
& \mathrm{LnL}^{+}+\mathrm{H}^{+} \xrightarrow{K_{\mathrm{H}, \mathrm{LLL}}} \mathrm{Ln}(\mathrm{HL})^{2+} \\
& \mathrm{Ln}(\mathrm{HL})^{2+} \xrightarrow{k_{\mathrm{Ln}(\mathrm{HL})}} \mathrm{Ln}^{3+}+\mathrm{HL}^{-} \tag{Eq_G}
\end{align*}
$$

The pseudo-first order rate constant for Ln (III) complex dissociation is defined as

$$
\begin{equation*}
k_{\mathrm{d}, \mathrm{obs}}=\frac{k_{\mathrm{Ln}(\mathrm{HL})} \times K_{\mathrm{H}, \mathrm{LnL}} \times\left[\mathrm{H}^{+}\right]}{1+K_{\mathrm{H}, \mathrm{LnL}} \times\left[\mathrm{H}^{+}\right]}=\frac{k_{\mathrm{H}} \times\left[\mathrm{H}^{+}\right]}{1+K_{\mathrm{H}, \mathrm{LnL}} \times\left[\mathrm{H}^{+}\right]} \tag{S29}
\end{equation*}
$$

where

$$
\begin{equation*}
k_{\mathrm{H}}=k_{\mathrm{Ln}(\mathrm{HL})} \times K_{\mathrm{H}, \mathrm{LnL}} \tag{S30}
\end{equation*}
$$
