

Supplementary Figure 1. Effect of internalisation inhibitors on IGF-I-mediated signalling.

Western blot analysis of signalling molecule activation in first trimester placental explants (n=4-9) treated with CPMZ (100 μ M; clathrin-mediated endocytosis inhibitor), β MCD (10 μ M), filipin (10 μ g/ml) (both inhibitors of caveolin-mediated endocytosis, cytochalasin D (10 μ M, actin polymerization inhibitor) or vehicle (DMSO 1/1000) for 30 min prior to treatment with IGF-I (20nM) for 30 min.
