1. General Information

Unless otherwise stated, all reagents were purchased from commercial suppliers and used without purification. All solvents were obtained from commercial sources and were purified according to standard procedures. For thin-layer chromatography (TLC), silica gel plates (HSGF 254) were used and compounds were visualized by irradiation with UV light. Purification of reaction products was carried out by flash column chromatography using silica gel (200-300 mesh). ^1H and ^{13}C NMR spectra were recorded on a Varian Mercury-300BB (300 MHz), a Bruker NMR Spectrometer (400 MHz), or a Bruker NMR Spectrometer (500 MHz). All chemical shifts (δ) were given in ppm. Chemical shifts (δ ppm) are relative to the resonance of the deuterated solvent as the internal standard (CDCl_3 , δ 7.26 ppm for proton NMR, δ 77.16 ppm for carbon NMR). Data are presented as follows: chemical shift, integration, multiplicity (br = broad, s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet) and coupling constant in Hertz (Hz). Mass spectra were recorded on the Bruker Agilent 1290 MicrOTOF Q II. Melting points were measured on a melting point apparatus and were uncorrected. The ee values determination was carried out using chiral HPLC (Waters) with Chiracel IA-3 column, Chiracel IC-3 column. Optical rotations were measured on a Shanghai ShenGuang SGW-2 Polarimeter at $\lambda = 589$ nm. Optical rotations are reported as follows: $[\alpha]_D^{25}$ ($c= \text{g}/100 \text{ mL}$, solvent)

2. Starting materials

All ketimines were prepared using reported procedures from corresponding isatins.¹ The chiral urea **3a**² and thioureas **3b**², **3c**³, **3d**⁴ and **3e**⁵ were prepared according to the procedure had been reported. All oxo-indanecarboxylates were prepared using reported procedures from corresponding Indanones⁶.

3. General procedure for racemic mixtures of Mannich reaction

Without protection of inert gases, oxo-indanecarboxylates (0.15 mmol, 1.5 equiv) and ketimines (0.1 mmol, 1 equiv) were dissolved in toluene (1 mL), the mixture was stirred at room temperature, DBU (3 μL , 0.2 equiv) was added in one portion, the resulting suspension was stirred at room temperature. Until complete disappearance of the starting materialsdetected by TLC, directly concentrated under reduced pressure. The crude product was purified by flash chromatography (PE/EA=5:1).

4. General procedure for enantio- and diastereoselective Mannich reaction

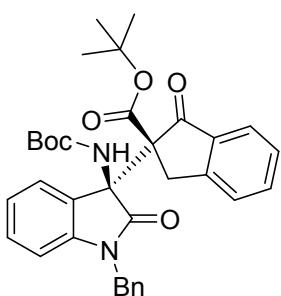

Method A: Without protection of inert gases, oxo-indanecarboxylates (0.15 mmol, 1.5 equiv) and cat **3e** (10 mol %) were dissolved in MTBE (1 mL), the mixture was stirred at -50 °C, ketimines (0.1 mmol, 1 equiv) was added in one portion, the resulting suspension was stirred at -50 °C. Until complete disappearance of the starting materials detected by TLC, directly concentrated under reduced pressure. The crude product was purified by flash chromatography (PE/EA=5:1).

Method B: Without protection of inert gases, oxo-indanecarboxylates (0.15 mmol, 1.5 equiv) and cat **3e** (10 mol %) were dissolved in MTBE (1 mL), the mixture was stirred at -40 °C, ketimines (0.1 mmol, 1 equiv) was added in one portion, the resulting suspension was stirred at -40 °C. Until complete disappearance of the starting materials detected by TLC, directly concentrated under reduced pressure. The crude product was purified by flash chromatography (PE/EA=5:1).

Method C: Without protection of inert gases, oxo-indanecarboxylates (0.15 mmol, 1.5 equiv) and cat **3e** (5 mol %) were dissolved in CHCl₃ (1 mL), the mixture was stirred at -50 °C, ketimines (0.1 mmol, 1 equiv) was added in one portion, the resulting suspension was stirred at -50 °C. Until complete disappearance of the starting materials detected by TLC, directly concentrated under reduced pressure.

The crude product was purified by flash chromatography (PE/EA=5:1).
