### **SI1. Key molecular orbitals (MOs) of INT<sub>01</sub>, INTa1 and INTb1.**

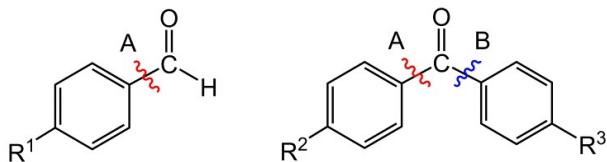

**Fig. S1.** Selected molecular orbitals (MOs) and MO energies (in eV) of INT<sub>O1</sub>, INTa1 and INTb1.

### SI2. Analysis of the substituent effect on C-C oxidative addition step.

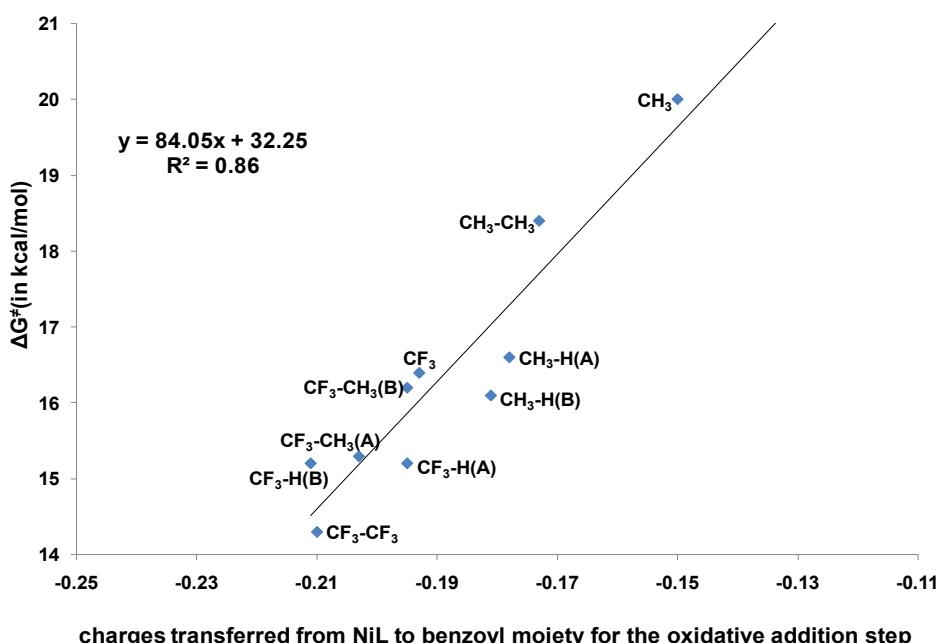

To study the substituent effect on C-C oxidative addition step, we evaluated the oxidative addition barriers for different substituents as shown in Table 1, from which we can see that two  $\text{CF}_3$  substituted substrate  $\text{CF}_3\text{-CF}_3$  characters are the most favorable oxidative addition transition state (entry 4 in Table S1). To gain more insights into the origins of the relative reactivity, NBO analysis was conducted for the substrates and corresponding oxidative addition transition states (Table S1). The charges transferred from NiL to phenyl and benzoyl moieties were calculated, respectively. Interestingly, a moderate linear correlation was observed between the oxidative addition barriers and the charges transferred from NiL to benzoyl moiety as shown in Fig. S2. The more the electrons transfer, the lower the oxidative addition barriers. When a  $\text{CF}_3$  substituent is present on the phenyl

group, the benzoyl moiety was more electron-deficient facilitating the electrons transfer from NiL to benzoyl and promoting the oxidative addition step.

**SI3.** Noncovalent interactions analyzation between substrates and IMes<sup>Me</sup> in **TSa7\_8** and **TSq3\_4**.

We designed two truncated model systems (**M1**, **M2**) based on the optimized structures of **TSa7\_8** and **TSq3\_4** and examined the effect of noncovalent interactions on the energy of **TSa7\_8** relative to **TSq3\_4**. Figure S2 shows the structures of **TSa7\_8**, **TSq3\_4** and the corresponding two truncated models **M1** and **M2**. Model **M1** represents the effect of noncovalent interaction between qionolynyl/trifluoromethyl phenyl and IMes<sup>Me</sup> on NHC ligand and methyl phenyl is reduced to H atom. Model **M2** represents the effect of noncovalent interaction between methyl phenyl and IMes<sup>Me</sup> on NHC ligand, and qionolynyl/trifluoromethyl phenyl is reduced to H atom. The two models are divided into two parts as Ni-NHC (denoted as A) and substrate (denoted as B). We calculated the single-point energies of the model structures and their corresponding two parts. The noncovalent interaction in every model is calculated as  $\Delta E(\mathbf{M})=[E(\mathbf{M})-E(\mathbf{M}_A)-E(\mathbf{M}_B)]$ . From the results we can see that the differences of noncovalent interactions between substrates and IMes<sup>Me</sup> in **TSa7\_8** and **TSq3\_4** are negligible. Photoshop and CYLview programs are used to visually depict the noncovalent interactions between the ligand and the substrate.

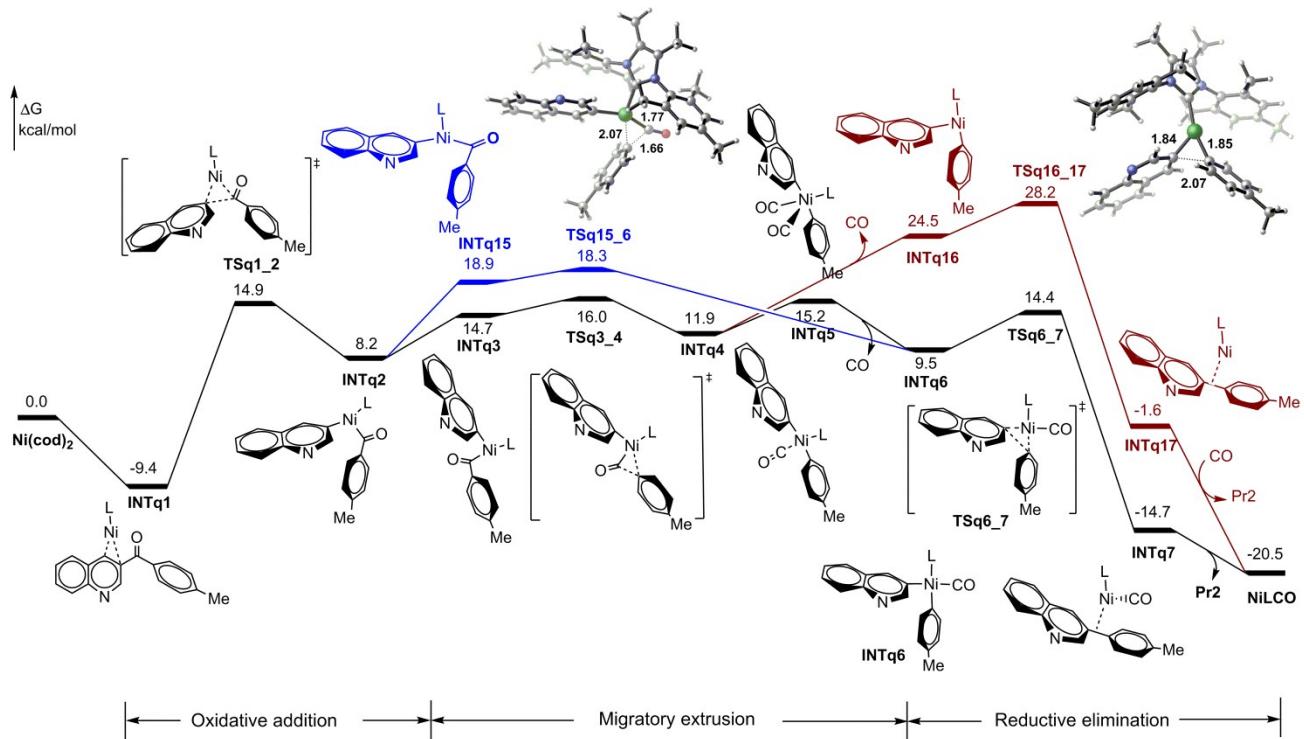

**Fig. S3.** Noncovalent interactions between substrates and IMes<sup>Me</sup> in TSa7\_8 and TSq3\_4.

**SI4.** Distortion/interaction model analysis of TSa7\_8 and TSq3\_4.

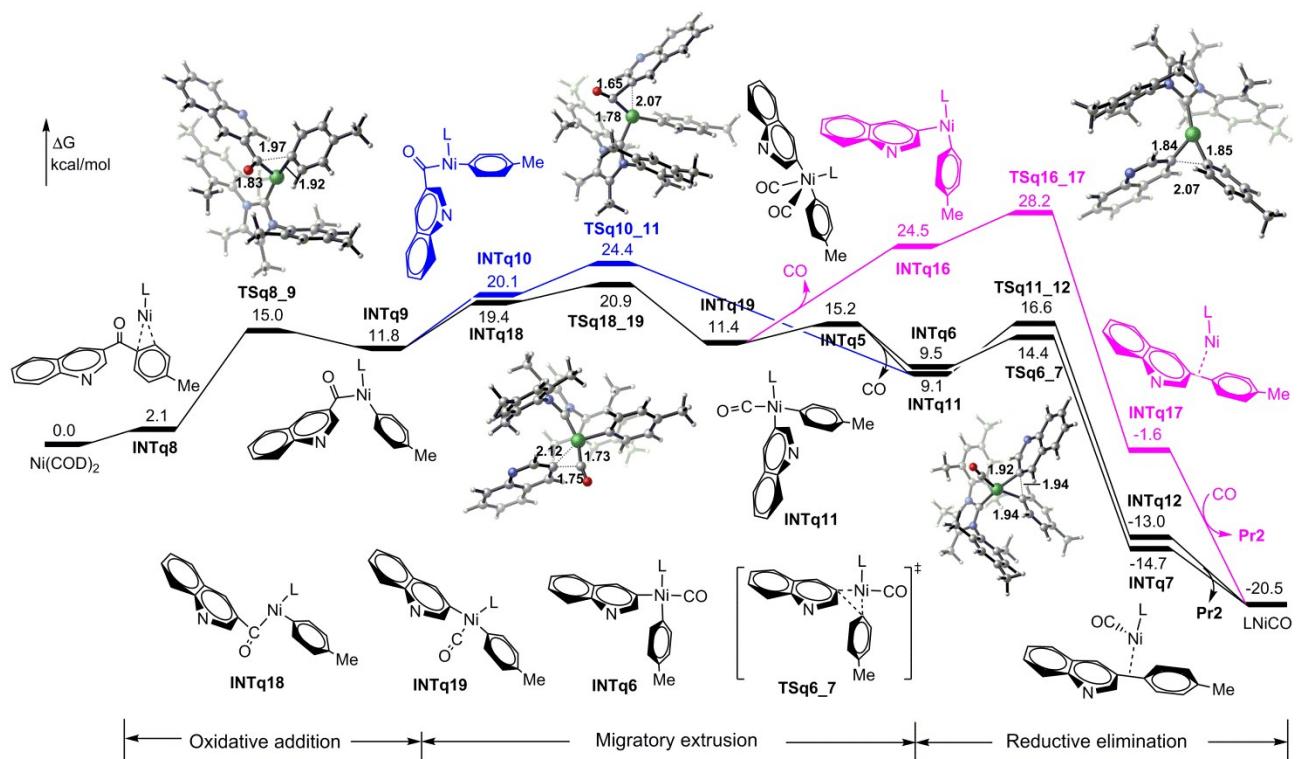

**Fig. S4.** Distortion, interaction, and activation energies for the TSa7\_8 and TSq3\_4. (blue: distortion energy of **frag\_A**, green: distortion energy of **frag\_B**, red: interaction energy, black: activation energy, in kcal/mol).

**SI5.** Computed free energy profiles for the decarbonylation of 3-quinolinyl ketone **2**.

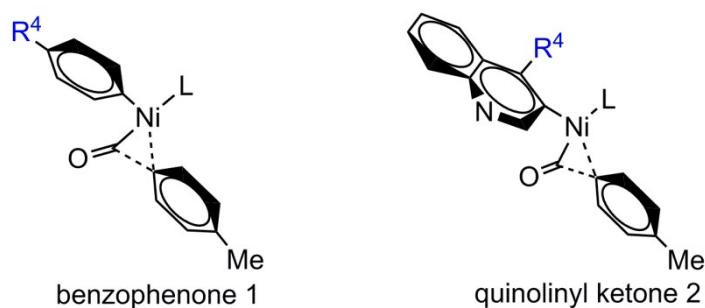

**Fig. S5.** Computed free energy changes of decarbonylation of 3-quinolinyl ketone **2** involving the cleavage of C(quinolynyl)-C(O). Free energies are in kcal/mol.

**Fig. S6.** Computed free energy changes of decarbonylation of 3-quinolinyl ketone **2** involving the cleavage of C(methylphenyl)-C(O). Free energies are in kcal/mol.

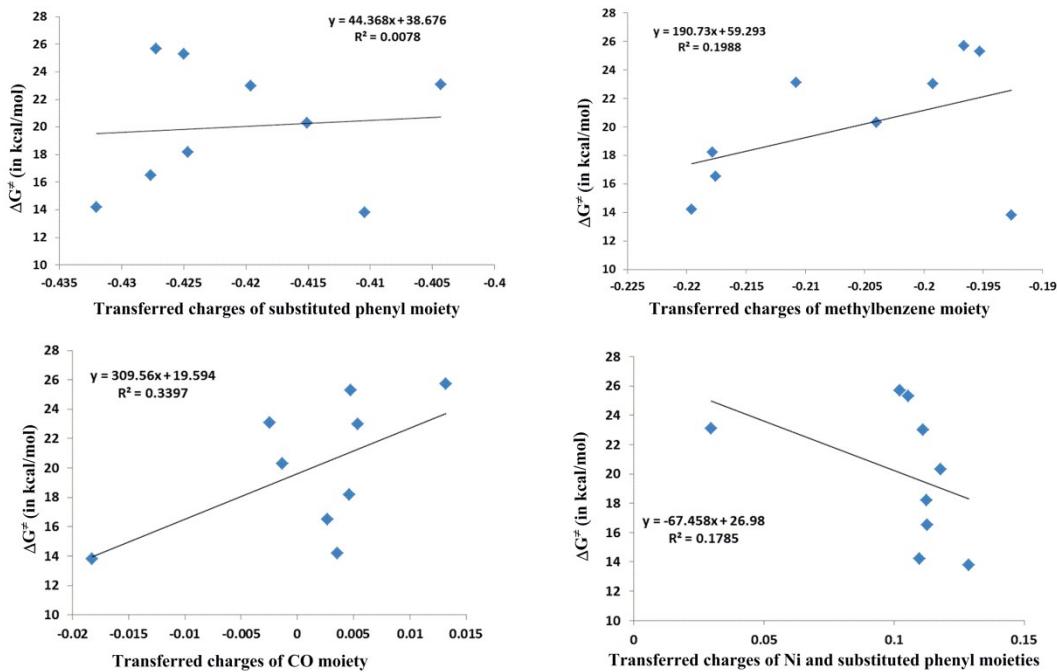

**SI6.** Analysis of the substituent effect in decarbonylation step.

In order to study the effect of substituents, decarbonylation transition state free energy barriers when different substituents substituted on phenyl and quinolinyl moieties were calculated. The results are given in Table S2. NBO analysis was conducted to evaluate the correlation between decarbonylation transition state barriers and the transferred charges from substrates to decarbonylation transition states. However, we found no clear correlation between the decarbonylation barriers and the amount of charges transferred. But the decarbonylation barriers of electron-withdrawing groups substituted reactants are generally lower than those of electron-donating groups substituted reactants indicating that electron-withdrawing groups are beneficial for the decarbonylation step. Additionally, the decarbonylation barriers of quinolinyl ketones are lower than those of benzophenones.
