## 1. General Information

<sup>1</sup>H NMR spectra were recorded on Bruker 500 MHz spectrometer and the chemical shifts were reported in parts per million ( $\delta$ ) relative to internal standard TMS (0 ppm) for CDCl<sub>3</sub>. The peak patterns are indicated as follows: s, singlet; d, doublet; dd, doublet of doublet; t, triplet; m, multiplet; q, quartet. The coupling constants,  $J$ , are reported in Hertz (Hz). <sup>13</sup>C NMR spectra were obtained at Bruker 125 MHz and referenced to the internal solvent signals (central peak is 77.0 ppm in CDCl<sub>3</sub>). The NMR yield was determined by <sup>1</sup>H NMR using CH<sub>2</sub>Br<sub>2</sub> as an internal standard. APEX II (Bruker Inc.) was used for ESI-HRMS. IR spectra were recorded by a Nicolet 5MX-S infrared spectrometer. Flash column chromatography was performed over silica gel 200-300. All reagents were weighed and handled in air at room temperature. All chemical reagents were purchased from Alfa, Acros, Aldrich, and TCI, J&K and used without further purification.

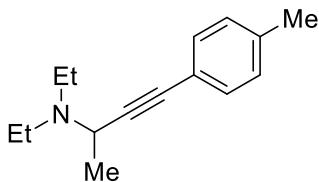

## 2. General procedure and characterization data for product 3

To a mixture of tertiary aliphatic amine **1** (1.0 mmol), 1-iodoalkynes **2** (0.20 mmol) and FeCl<sub>2</sub> (2.6 mg, 10 mol%), MeCN (1.0 mL) was added under nitrogen at room temperature. *tert*-Butyl hydroperoxide (TBHP-decan) (1.0 mmol) was dropped into the mixture under nitrogen at room temperature. The resulting mixture was stirred at 120 °C for 12 h. After the mixture was cooled to room temperature, the solvent was removed under reduced pressure. The crude product was purified by flash column chromatography on silica gel (ethyl acetate/petroleum ether) to give the product **3** as yellow oil.
