## 1. General Experimental Details

All commercially available chemicals were used without further purification.  $^1\text{H}$  NMR spectra were obtained on Bruker 500 MHz FT-NMR and 400 MHz FT-NMR spectrometers.  $^{13}\text{C}$  NMR spectra were recorded at 125 MHz and 100 MHz. Chemical shifts are reported in relative to the solvent signal. Multiplicity is indicated as follows: s (singlet); bs (broad singlet); d (doublet); t (triplet); q (quartet); m (multiplet); dd (doublet of doublets), etc. TOF and quadrupole mass analyzer types are used for the HRMS measurements IR spectra were recorded on FT/IR-5700 instrument. 3,5-dimethyl-4-nitroisoxazoles were synthesized as described in the literature<sup>1</sup>.

### 1.1 General procedure

A mixture of indenoquinoxalinone **2a-c** (0.5 mmol) or isatins **5a-e** and L-proline **3** (0.6 mmol) and 3-methyl-4-nitro-5-alkenyl-isoxazoles **1a-l** (0.6 mmol) to stirring suspension of graphene oxide (0.50 wt.% in water) in water:ethanol (80:20) solvent system and stirred under air atmosphere for the 30 min. reaction can be visualized by the change of color change in the reaction pot. Once the starting material was found to be consumed (by TLC), EtOH was removed under reduced pressure and the aqueous layer was diluted with ethyl acetate, leading to formation of two distinct layer with catalyst GO at inter phase of the water/ethyl acetate layers. Then this mixture is filtered through filter paper and the organic layer is separated followed by extracting water layers with EtOAc (5 x 3 mL). The organic layer was washed with brine, dried over anhydrous  $\text{NaSO}_4$  and passed through pad of celite to trap any particulate impurities of catalyst. Combined organic layer was concentrating under vacuum to afford crude solid which was further purified by washing with 2 x 5 mL cold methanol to afford pure products **4a-u** and **6a-l** as colorless to pale yellow solids.

Recyclability experiment was done on 10 mmol scale; at the end of the experiment GO was recovered by dissolving the solid product in ethyl acetate followed by centrifugation at 15000 rpm for 1 hours and washed by repeating the process for five times to remove all the traces of organic compounds on GO catalyst.

## 1.2 Spectral data of Spiro-Indenoquinoxaline Pyrrolizidines
