Summary of information provided:

Table S1. Summary of the different thermal treatments carried with the mesoporous nanorods.

Table S2. Specific surface values, pore sizes and pore volumes for untreated and treated mesoporous nanorods.

Table S3. Summary of the XPS analysis parameters for the luminescent mesoporous nanorods.

Table S4. Summary of the current state-of-the-art nanomaterials with peroxidase-mimicking activity.

Figure S1. Small-angles X-ray diffraction patterns corresponding to the LMS@C, LMS@Si@C and LMS@Si samples.

Figure S2. Representative TEM and STEM images after the different flash-thermal treatments

Figure S3. Control experiments carried out to demonstrate the presence of carbogenic dots after the digestion of the silica structure under strong basic conditions. Analysis of the dialyzed samples by TEM and Fluorescence spectroscopy.

Figure S4. Control experiment to confirm the association of the PL response in the LMS@Si sample and the presence of silica-based emitting centers. Evolution of the PL spectra before and after digestion in strong basic conditions and subsequent dialysis

Figure S5. Influence of the LED irradiation time on the peroxidase-mimicking performance of the LMS catalysts towards the oxidation of TMB in the presence of H₂O₂.

Figure S6. Control experiments in the absence of light or LMS catalysts.

Figure S7. Control experiment in the absence of hydrogen peroxide in the peroxidase-like activity of the LMS@Si@C.

Figure S8. Investigation of the effect of illuminating with different LED wavelengths on the photocatalytic activity of the different catalysts.

Figure S9. Digital images of the experimental setup and schematic display of the experimental setup for peroxidase enzymatic assays using TMB performed in MW24 cell culture plates.

Fig. S10. Detection of hydroxyl radicals (*OH) generated from H₂O₂ and schematic illustration of the colorimetric assay performed to identify the presence of hydroxyl radicals using disodium terephthalate (NaTA).

Figure S11. Influence of the initial concentration of the LMS@Si@C sample on the final performance as peroxidase-mimicking surrogate.

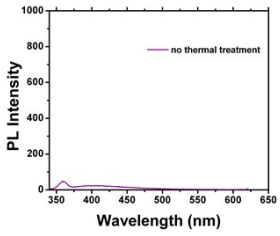

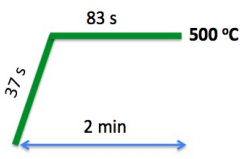

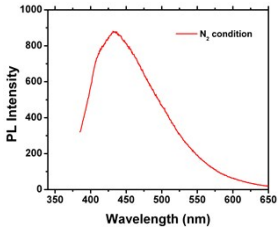

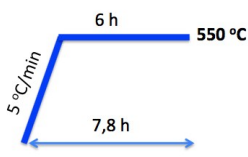

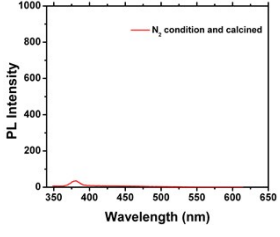

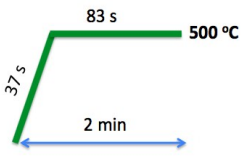

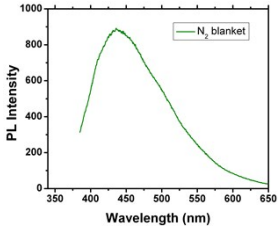

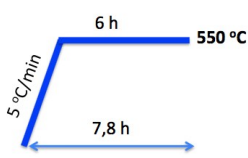

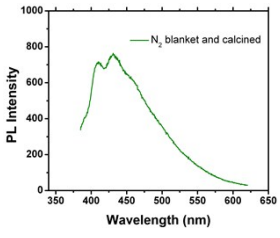

Figure S12. Influence of the reaction temperature on the peroxidase-like activity of the LMS@Si@C catalyst in comparison with the photo-enhanced response observed after 5 min irradiation with a blue LED at 405 nm.

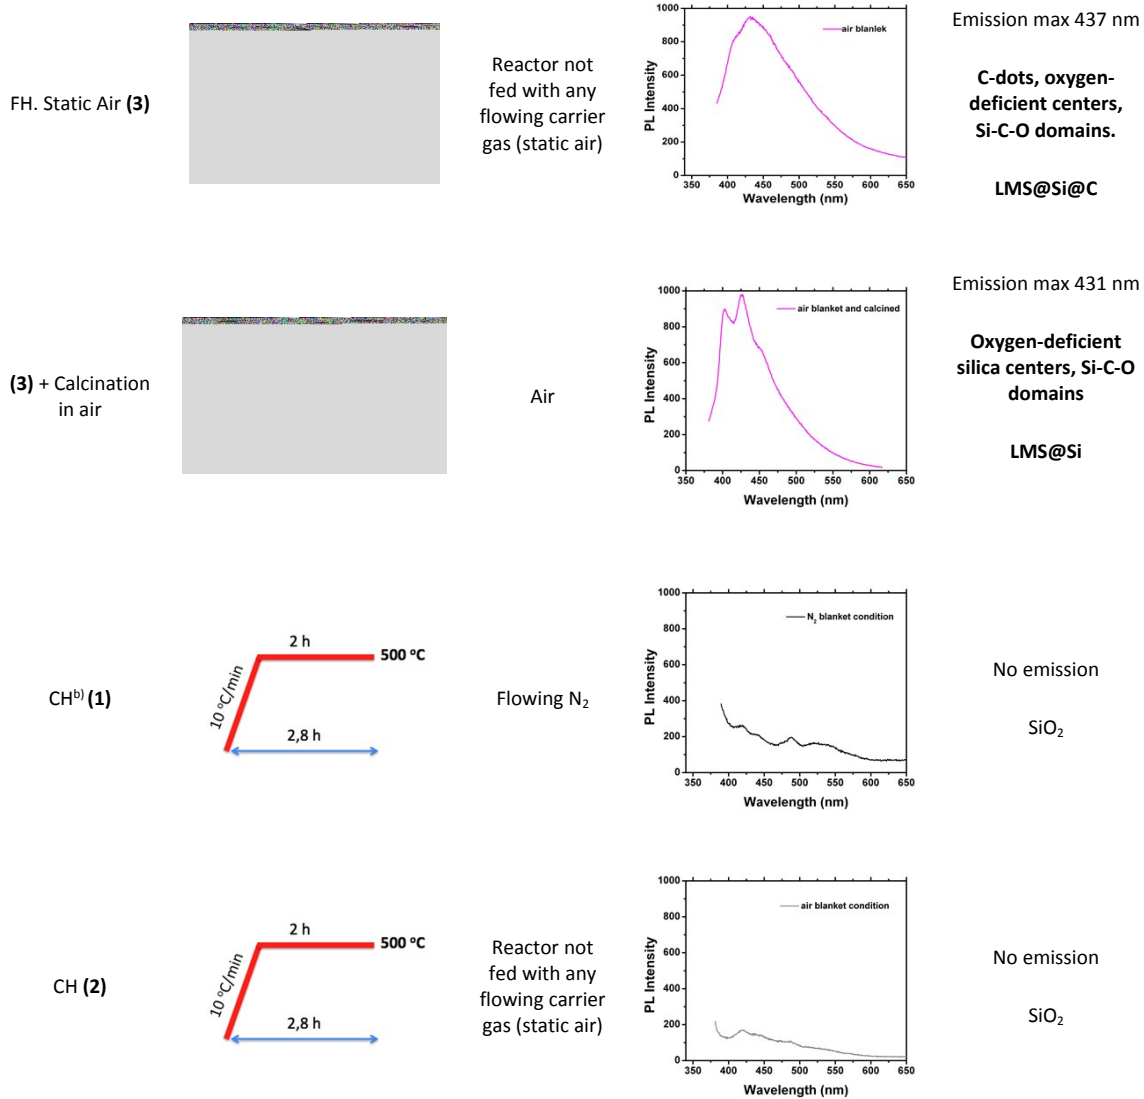

Figure S13. Reusability of the peroxidase-like catalyst after 3 consecutive cycles.

Figure S14. Use of the LMS@Si@C in the indirect and selective detection of glucose.

Electronic Supplementary Information References

Table S1. Summary of the different thermal treatments carried out on the mesoporous nanorods and the corresponding photoluminescent responses.

Sample	Heating treatment	Reaction Conditions	Photoluminescence spectrum	Remarks
Mesoporous Nanorods	No thermal activation			No PL emission SiO ₂ network
FH ^a . N ₂ flow (1)		Flowing N ₂ as carrier gas		PL emission maximum centered at 434 nm Preferential generation of C-dots LMS@C
(1) + Calcination in air		Air		No PL emission SiO ₂
FH. N ₂ static (2)		Reactor initially fed with N ₂ (no continuous flow of carrier gas)		Emission max 432 nm C-dots, oxygen-deficient silica centers, Si-C-O
(2) + Calcination in air		Air		Emission max 426 nm Oxygen-deficient silica centers, Si-C-O domains

^{a)}FH: flash-thermal heating treatment carried out in a fluidized-bed reactor;

^{b)}CH: conventional heating treatment carried out in a tubular reactor.

Table S2. Specific surface values, pore sizes and pore volumes calculated from the N₂ adsorption-desorption isotherms for untreated and treated mesoporous nanorods.

Sample	S _{BET} [m ² g ⁻¹]	Pore size [nm]	Total pore Volume [cm ³ g ⁻¹]
MS	456.8	10.3	1.2
LMS@C	454.8	9.1	1.1
LMS@Si@C	481.3	9.3	1.2
LMS@Si	552.8	8.5	1.2

Table S3. Surface chemistry analysis of the luminescent mesoporous nanorods. Fitted X-ray photoemission assignments of the C1s, O1s and Si 2p region in the LMS@C, LMS@Si@C and LMS@Si samples, respectively.

Sample	C 1s	O 1s	Si 2p
	Binding energy, eV (At %)	Binding energy, eV (At %)	Binding energy, eV (At %)
LMS@C	284.2 C-C/C=C/C-H (9.14)	532.3 SiO ₂ (49.36)	102.0 Si-CH _x (9.74)
	285.3 C-O (6.2)		102.8 Si-O (24.52)
	287.9 C=O (1.04)		
LMS@Si@C	284.2 C-C/C=C/C-H (1.72)	530.4 C=O(58.82)	101.9 Si-CH _x (9.27)
	285.6 C-O (1.21)	532.2 SiO ₂ (2.71)	101.1 Si-Si (26.23)
	287.9 C=O (0.04)		
LMS@Si	284.2 C-C/C=C/C-H (2.11)	530.6 (36.36)	101.9 Si-CH _x (20.86)
	282.7 C-Si (0.51)	531.7 SiO ₂ (20.39)	101.1 Si-Si (6.15)
	285.9 C-O (1.84)		103.3 Si-O (11.79)

Table S4. Summary of the current state-of-the-art nanomaterials claiming a peroxidase-mimicking activity reported in the literature. Overview of multiple experimental conditions and kinetics parameters.

ADDITIONAL FIGURES

Fig. S1 Small-angle X-ray diffraction patterns corresponding to the LMS@C, LMS@Si@C and LMS@Si samples. It can be found that both samples LMS@C and LMS@Si@C show three diffraction peaks, were indexed to (100), (110), (200) which are characteristic of 2D hexagonal mesoporous silica SBA-15. The LMS@Si mesostructures showed a peak, which was indexed as (100). This shows that the LMSs mesostructure is maintained after the flash-thermal treatments.

Fig. S2 Representative TEM and STEM images of the rod-shaped mesoporous nanostructures after the different flash-thermal treatments: a) LMS@C; b) LMS@Si@C and c) LMS@Si, respectively.

Fig. S3 Control experiments carried out to demonstrate the presence of carbonogenic dots after the digestion of the silica structure under strong basic conditions. Analysis of the dialyzed samples by TEM and Fluorescence spectroscopy: a) TEM analysis of the non-treated samples after digestion and dialysis; b) TEM analysis of the LMS@C sample after digestion and dialysis where the presence of carbon dots is observed; c) TEM analysis of the LMS@Si@C sample after digestion and dialysis, again displaying the presence of carbon dots; d-f) Photoluminescence spectrum after basic digestion and dialysis of (d) the non-treated mesoporous rod; (e) the LMS@C sample (f) the LMS@Si@C sample.

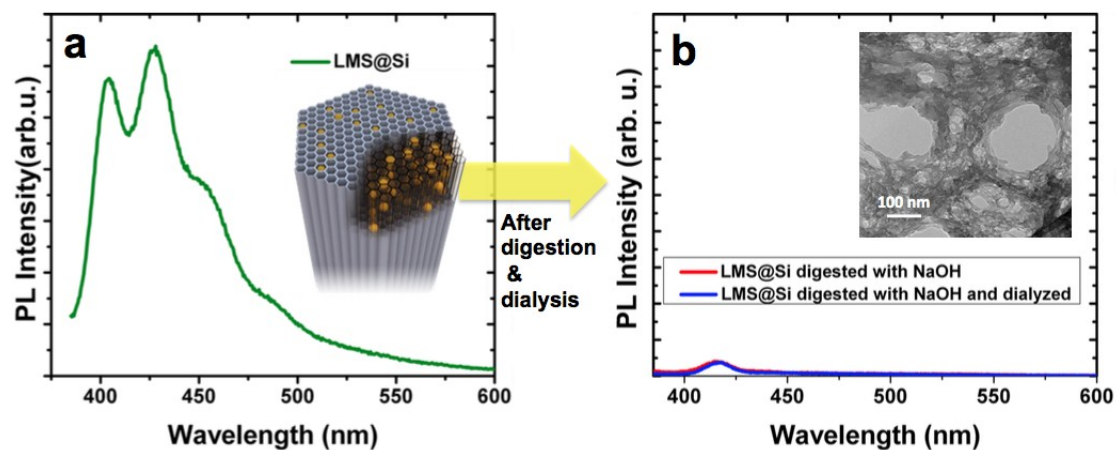

Fig. S4 Control experiment to confirm the association of the PL response in the LMS@Si sample with the presence of silica-based emitting centers. PL spectra before (a) and after (b) digestion of the silica matrix under strong basic conditions and subsequent dialysis: a) PL spectrum of the LMS@Si sample; b) PL spectrum of the same sample after digestion with NaOH and dialysis (inset: TEM image of silica remains).

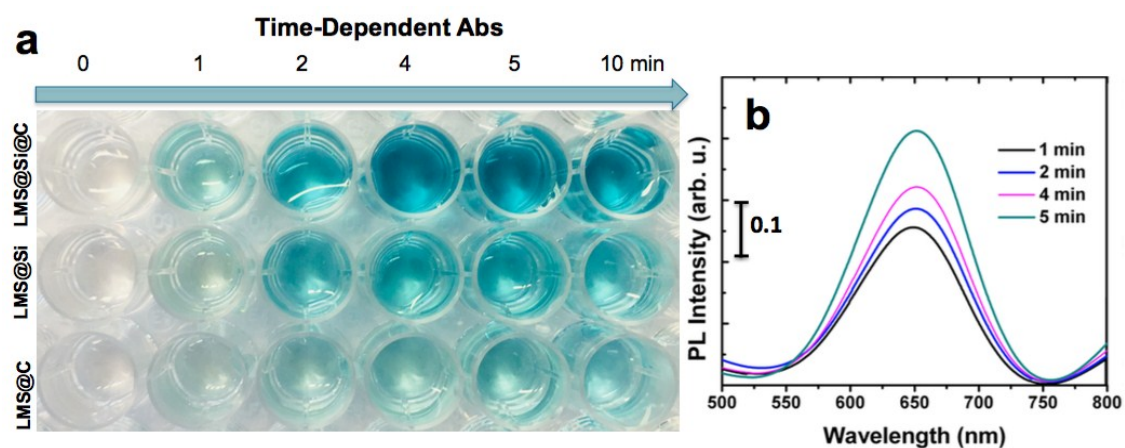

Fig. S5 Performance of the different LMS catalysts towards the oxidation of TMB in the presence of H_2O_2 : a) Digital photograph showing progressive coloration due to the oxidation of TMB under a blue-emitting LED at 405 nm (up to 10 minutes). b) UV-Vis absorption spectra displaying the evolution of the TMB_{ox} upon increasing irradiation times with the blue LED. Experimental details: $[\text{H}_2\text{O}_2] = 10 \text{ mM}$; $[\text{LMSs}] = 4 \mu\text{g mL}^{-1}$; $[\text{TMB}] = 0.16 \text{ mM}$; $\text{pH} = 7.4$ in 0.2 M NaAc buffer; irradiation experiments with a blue LED ($\lambda_{\text{exc}} = 405 \text{ nm}$); and reaction temperature: $19\text{-}20 \text{ }^\circ\text{C}$.

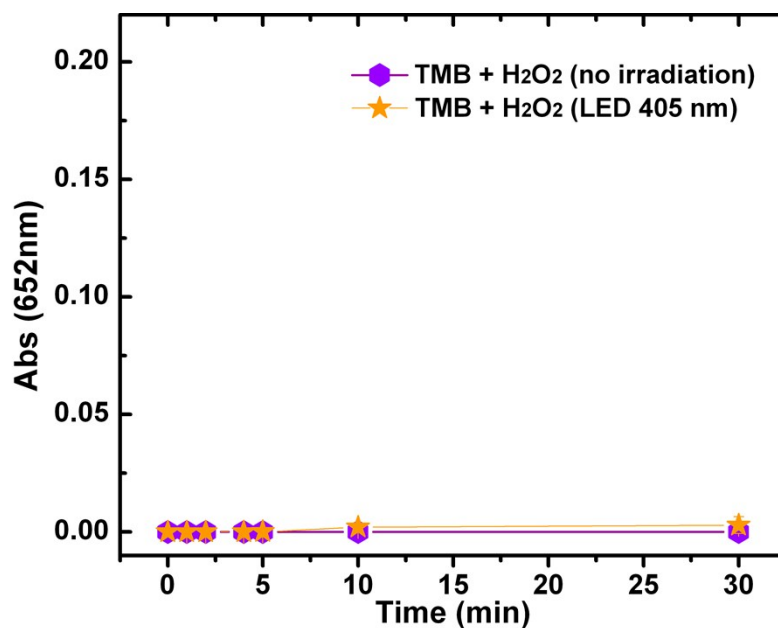

Fig. S6 Control experiments in the absence of light or LMS catalysts. Time-dependent evolution of the maximum in the absorbance of the TMB oxidized intermediate centered at 652 nm for the TMB+H₂O₂ (no irradiation, no catalyst) and TMB+H₂O₂ + LED 405 nm (no catalyst).

Fig. S7 Control experiment to evaluate the absence of hydrogen peroxide in the peroxidase-like activity of the LMS@Si@C enzyme-like photocatalyst. Time-dependent absorbance change TMB at 652 nm for the LMS@Si@C after 30 min of irradiation with Blue-LED ($\lambda_{exc} = 405$ nm) (no H₂O₂ added).

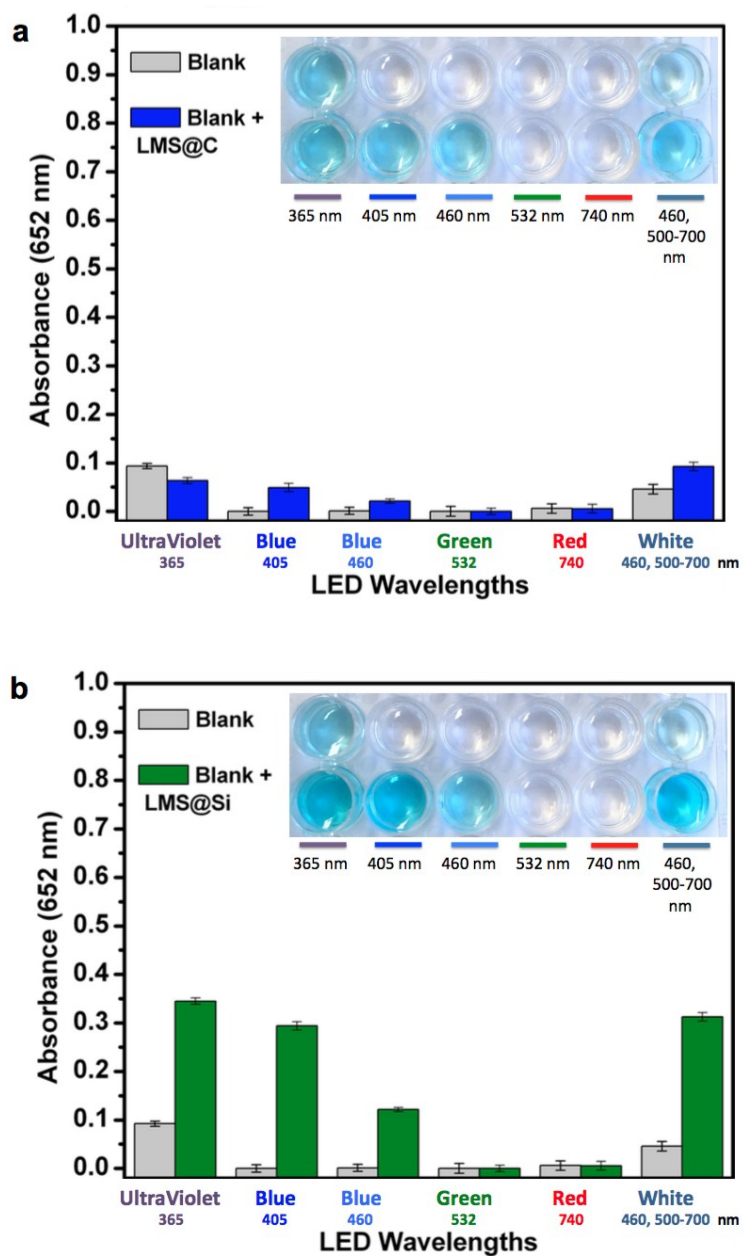

Fig. S8 Investigation of the effect of illuminating with different LED wavelengths on the photocatalytic activity of: a) LMS@C catalyst and b) LMS@Si catalyst. Experimental conditions: [catalyst] = 4 $\mu\text{g mL}^{-1}$; [TMB] = 0.16 mM; [H_2O_2] = 10 mM; pH = 7.4 (0.2 M NaAc buffer); total volume = 2mL; Irradiation time = 5 min (Inset: digital image of wells containing reaction mixtures after 5 min under irradiation with UV LED, blue LED-405, blue LED-460, green LED-532, red LED-740 and white LED, respectively). The error bars represent the standard deviation of three measurements.

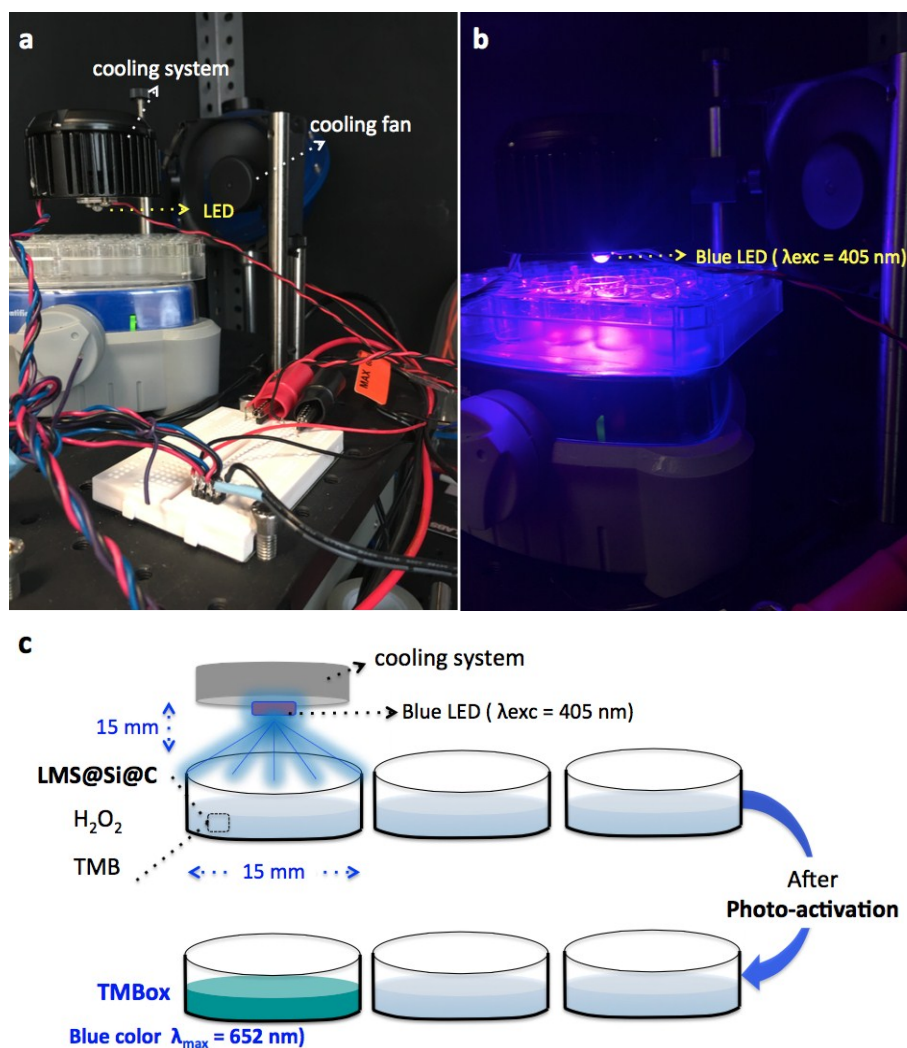

Figure S9. (a) Digital images of the experimental setup; (b) Digital image corresponding to the experimental setup while irradiating the cell culture wells with the blue-emitting LED ($\lambda_{exc} = 405 \text{ nm}$); and (c) Schematic display of the experimental setup for peroxidase enzymatic assays using TMB performed in MW24 cell culture plates.

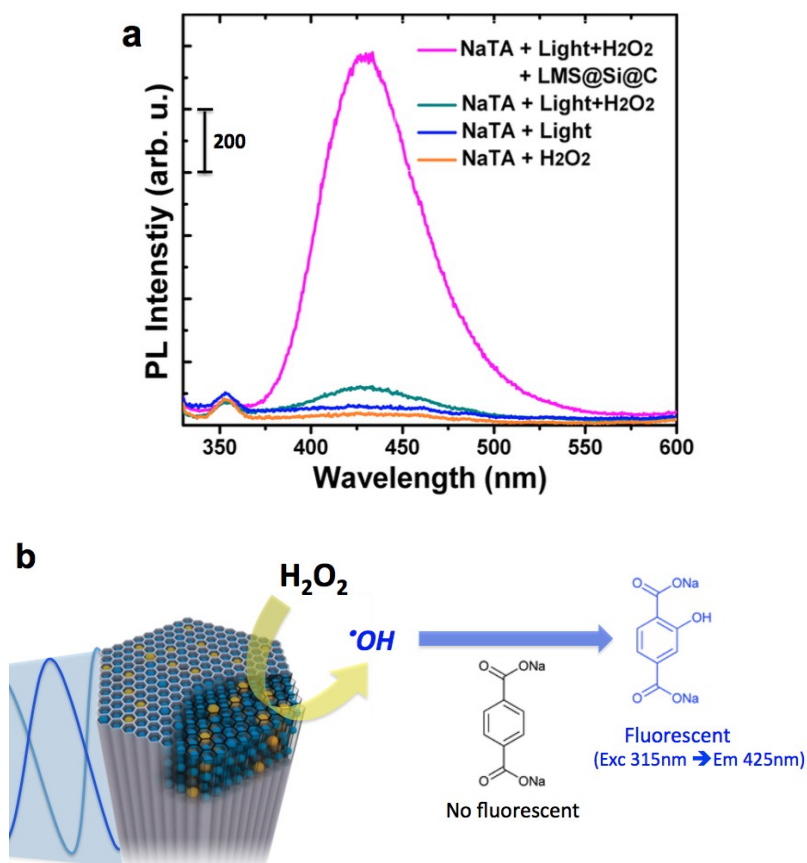

Fig. S10 a) Detection of hydroxyl radicals ([•]OH) generated from H₂O₂ using disodium terephthalate (NaTA) as a fluorescent probe emitting at 425 nm after reaction with the [•]OH radicals (fluorescence spectra taken from reaction aliquots at reaction time t = 5 min). Experimental details: [H₂O₂] = 10 mM; [LMSs] = 4 μg mL⁻¹; [NaTA] = 5 mM; pH = 7.4 in 0.2 M NaAc buffer; irradiation experiments with a blue LED (λ_{exc} = 405 nm); and reaction temperature: 19-20 °C; specific dilutions and the generation of NaTA are further described in the experimental section; b) Schematic illustration of the colorimetric assay performed to identify the presence of hydroxyl radicals using disodium terephthalate (NaTA): The reaction occurs between hydroxyl radicals generated *in situ* in the presence of the LMS catalysts under blue-LED irradiation and the NaTA molecule that forms a selectively hydroxylated fluorescent derivative.

Fig. S11 Influence of the initial concentration of the LMS@Si@C sample on the performance as peroxidase-mimicking surrogate. Experimental details: $[H_2O_2] = 10 \text{ mM}$; [LMSS] = different concentration, see graphic (0-1-2-4-5-6.5-8 $\mu\text{g mL}^{-1}$); $[TMB] = 0.16 \text{ mM}$; $\text{pH} = 7.4$ in 0.2 M NaAc buffer; irradiation experiments with a blue LED ($\lambda_{\text{exc}} = 405 \text{ nm}$); and reaction temperature: 19-20 °C.

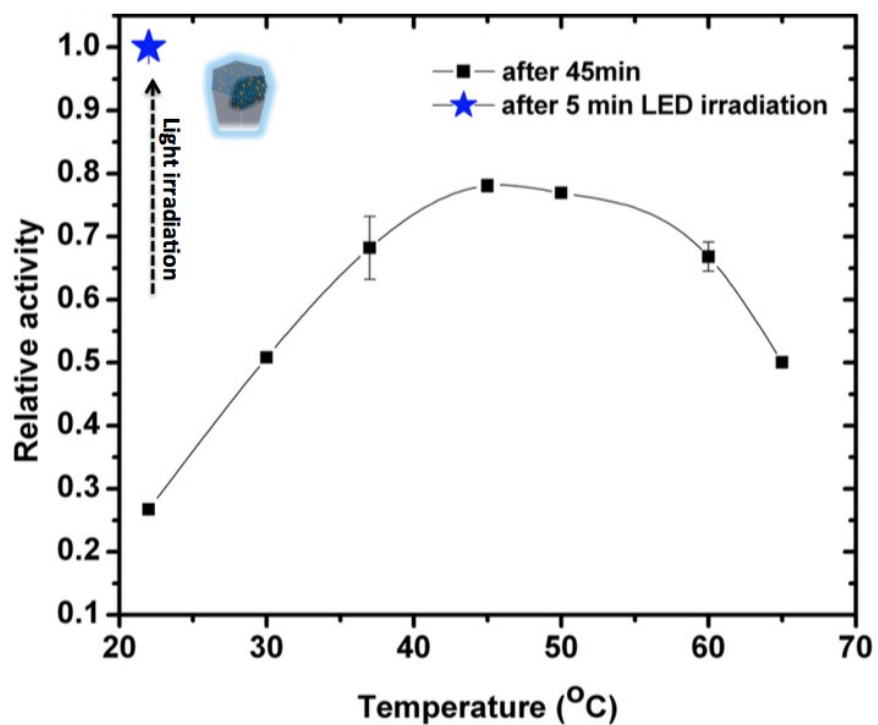

Fig. S12 Influence of the reaction temperature on the peroxidase-like activity of the LMS@Si@C catalyst (after 45 min reaction time). The response at room temperature following a 5 min illumination with a 405 nm LED light is also shown for comparison. Experimental details: $[H_2O_2] = 10 \text{ mM}$; $[LMSs] = 4 \mu\text{g mL}^{-1}$; $[TMB] = 0.16 \text{ mM}$; $\text{pH} = 7.4$ in 0.2 M NaAc buffer; irradiation experiments with a blue LED ($\lambda_{\text{exc}} = 405 \text{ nm}$) and reaction temperature: $19\text{-}20 \text{ }^\circ\text{C}$; or without LED irradiation and different temperatures, $22\text{-}30\text{-}37\text{-}45\text{-}50\text{-}60\text{-}65 \text{ }^\circ\text{C}$.

Fig. S13 Reusability of the peroxidase-like catalyst after 3 consecutive cycles.

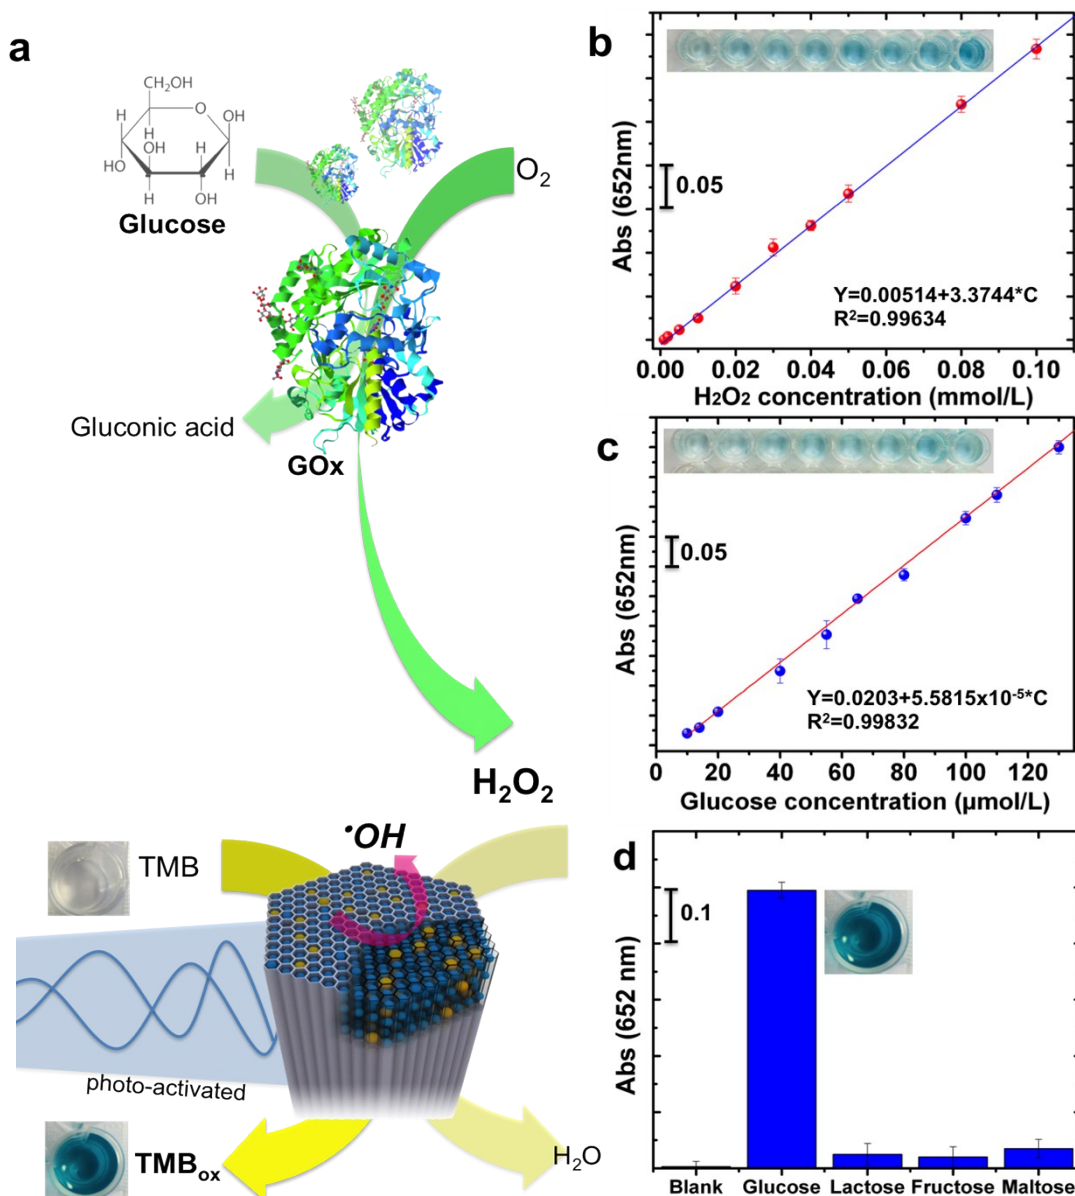

Figure S14. Use of the LMS@Si@C peroxidase-like photocatalyst in the indirect and selective detection of glucose: a) Schematic illustration of the cascade catalytic steps to indirectly detect glucose using the combination of a glucose oxidase natural enzyme and the peroxidase-like artificial mesoporous rod (LMS@Si@C). GOx oxidizes glucose to produce H_2O_2 that subsequently reacts with TMB in the presence of the peroxidase-like catalyst (LMS@Si@C); b) Evaluation of the lineal response to detect increasing concentrations of H_2O_2 concentration from 0.0010–0.10 mM with a detection limit (DL) of 1.5 μM ; c) Evaluation of the indirect quantification of glucose (previously converted into gluconic acid and H_2O_2 by GOx) in the 10–130 μM range with a detection limit (DL) of 0.5 μM due to the selective reaction of the hydrogen peroxide in the presence of the catalyst; Error bars represent the standard deviation for three measurements; d) Determination of the selectivity of glucose detection with 10 mM lactose, 10 mM fructose, 10 mM maltose, and 10 mM glucose. The error bars represent the standard deviation of three measurements. Inset: The color change with the different solutions.
