Access to P-Chiral Phosphine Oxides by Enantioselective Allylic Alkylation of Bisphenols

Guo Hui Yang, Yao Li, Xin Li* and Jin-Pei Cheng

Abstract: A novel biscinchona alkaloid-catalyzed highly enantioselective desymmetrization reaction of bisphenol compounds by using achiral Morita–Baylis–Hillman carbonate agents was developed. Through the asymmetric allylic alkylation strategy, a broad range of optically active P-stereogenic phosphine oxides were generated with good yields (up to 99%) and high enantioselectivities (up to 98.5:1.5 e.r.). The linear free energy relationship (LFER) analysis was introduced to investigate the reaction. And a possible transition state was proposed, which was verified by theoretical calculations.

General information

Commercially available materials purchased was used as received. ^1H NMR were recorded on a Bruker Avance (400 MHz) spectrometer, and reported as δ in units of parts per million (ppm) relative to tetramethylsilane (δ 0.00), and splitting patterns are designated as singlet (s), doublet (d), triplet (t), quartet (q), dd (doublet of doublets), m (multiplets). ^{13}C NMR were reported on a Bruker Avance (101 MHz) spectrometer, and reported as δ in units of parts per million (ppm) relative to the signal of chloroform-d (δ 77.16 triplet). ^{31}P NMR were reported on a Bruker Avance (162 MHz) spectrometer. ^{19}F NMR were reported on a Bruker Avance (376 MHz) spectrometer. Mass spectra were obtained using electrospray ionization (ESI) mass spectrometer. And the novel substrates and products were characterized in this ESI.

Experimental Section

1. General procedure for the synthesis of substrates

1.1 General procedure for the synthesis of substrates 1

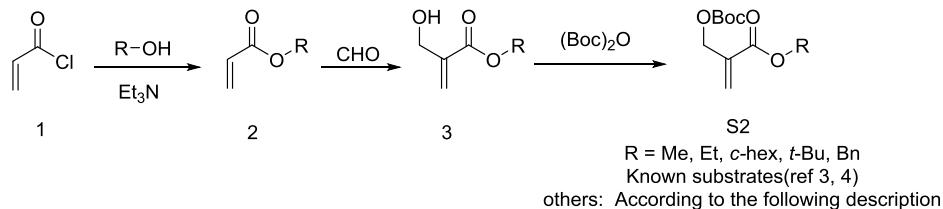

To a dry round bottomed flask equipped with a magnetic stir bar, added Phenols 1 (1 equiv) in THF, then 2 NaH (1.2 equiv) was added with nitrogen. The reaction was stirring at 0 °C for 30 minutes. When the reaction completed, 3 (0.5 equiv) was added to the mixture at 0 °C for 1h with nitrogen, and then 24h at room temperature. Extracted with CHCl_3 and the organic phase was dried over MgSO_4 . The resulting crude residue was purified via column chromatography on silica gel to afford the desired products 4.

To a dry round bottomed flask equipped with a magnetic stir bar, added LDA (4 equiv) at -78 °C, 4 (1 equiv) dissolved in pure and dry THF was added in 60 min at -78 °C. The resulting reaction mixture was stirred at -78 °C for another 60 min, then it was allowed to warm up to rt and it was stirred at rt for 12 h. After the reaction was completed, quenched with saturated aqueous NH_4Cl solution, then extracted with CHCl_3 . The organic phase was separated and the combined organic phase was dried over MgSO_4 , filtered and the solvent was removed. The crude product was first purified by

chromatography on silica gel using an ethyl acetate/petroleum 1:10 to give pure **S1**.

And the novel substrates **S1** were characterized in this ESI (Page 72-73).

1.2 General procedure for the synthesis of Boc protect MBH substrates **2**.

R-OH (1 equiv) and triethylamine (1.2 equiv) were dissolved in DCM in a flask and the flask was cooled down to 0 °C.

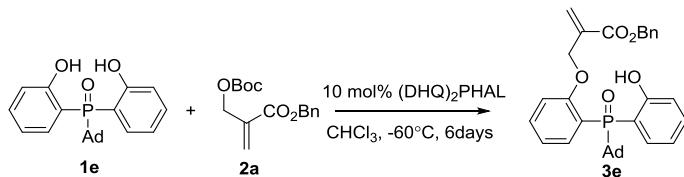

Acryloyl chloride (1.2 equiv) was added slowly over 15 mins. The reaction was allowed to gradually warm to room temperature and stirred for another 2 hours. The reaction was quenched with aq. NaHCO₃ and the DCM phase was isolated and dried over anhydrous MgSO₄. The solvent was removed under reduced pressure and the resultant mixture was distilled under vacuum to give products 2.

And then a solution of formaldehyde solution (1 equiv) and products 2 (3 equiv) in 1,4-dioxane:water (1:1, v/v) were stirred at room temperature in the presence of 100 mol% DABCO, and the reaction progress was monitored by TLC, then extracted, the organic phase was washed with brine, dried over anhydrous MgSO₄, filtered, and concentrated under reduced pressure. The crude product was purified by flash column chromatography on silica to give the desired product To an oven-dried round bottom flask equipped with a magnetic stir bar were added 3 (1 equiv) and ((Boc)₂O, 1 equiv), and DMAP (10 mol%), followed by DCM. The reaction mixture was stirred at room temperature for 2 hours, washed with water, dried with MgSO₄ and concentrated in vacuo. The crude products was purified by flash column chromatography to give the desired acrylic ester **S2**.

And the novel substrates **S2** were characterized in this ESI (Page 73-75).

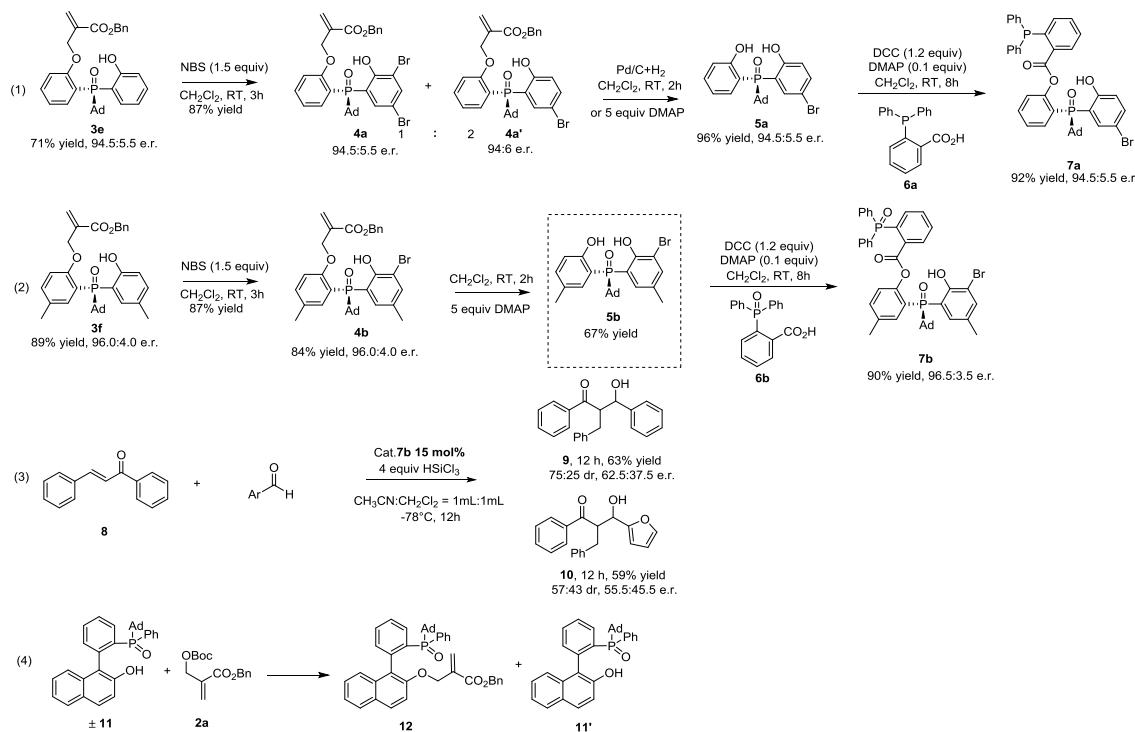

1.3 General procedure for this reaction.

Example for the synthesis of **3e**:

The compound **1e** (0.1 mmol, 36.8 mg), **2a** (0.2 mmol, 2.0 equiv, 58.4 mg) and catalyst **4f** (DHQ)₂PHAL (20 mol%, 15.6mg) were added to a 10 mL glass reactor, and then 1 mL CHCl₃ was added. The reaction was stirred at -40°C for 6 days. The mixture was chromatographed on a silica gel column eluted with PE:EA = 5:1 to afford the desired product **3e**.

1.3 General procedure for the derivatization experiments.

(4) The compound **11** (0.1 mmol, 47.8 mg), catalyst **hydroquinine** (10 mol%, 3.26mg) and **2a** (0.055 equiv, 0.055 mmol, 14.2 mg) was dissolved in 1mL CH₂Cl₂. The reaction was stirred at room temperature for 12 h. The mixture was chromatographed on a silica gel column eluted with PE:EA = 4:1 to afford the desired products **12** and **S11'**.

2. Linear free energy relation (LFER) researches

2.1 Linear FER between the log (e.r.) values of products **3** and the Charton constants¹

Table 1 The log (e.r.) values of products and the Charton constants. (Conditions: -40 °C, 20 mol% catalyst, 6d, CHCl₃)

products	Charton constants	substituent	e.r.values	log (e.r.)

Using these data we got in Table 1, a very good linear FER ($R^2 = 0.97$) between the log (e.r.) values and the Charton constants of the alkyl substituted products **3e-h** was founded. And halogen substituted products **3l-o** have their own

linear correlation between the log (e.r.) values and the Charton constants with $R^2 = 0.99$.

b. Using the data we got in Table 2, we also got a considerable linear FER between the log (e.r.) values of products 5 and

the Charton constants with $R^2 = 0.92$.

2.3 Correlation studies related to the computation

All substrates mono negative ion studied here were geometrically optimized at M06-2X/6-311g(d,p) level (SDD for I atom) with Gaussian 09 software.¹⁻³ SMD solvating model was used for describe the solvating effect of chloroform.⁴ IR vibration values were obtained by performing frequency analysis at the same level. Sterimol parameters were calculated for the geometry optimized structures using Molecular Modeling Pro software.⁵ NPA charges were obtained using NBO package build-in Gaussian 09.⁶ Charton values were taken from literature.⁷ The stepwise regression was performed using Matlab (R2018a) software.⁸ All parameters examined in this study were listed in Table S1-S2.

3. Computation studies

Unless noted, all energetics are reported in kcal/mol, and the bond lengths are reported in angstroms (Å).

Structures were generated using CYLview.⁹ Due to the large catalysis system, to reduce the computation time, transition states towards product **3k** were explored and benzyl-substituted MBH carbonates were simplified to methyl-substituted

ones. All transition states were optimized using the ONIOM method implemented in Gaussian09¹ at gas phase. M06-2X functional² with 6-31G(d) basis set was used for the high-layer and PM6 method for the low-layer. Quinuclidine ring moiety of the catalyst, which is far from reaction center, was treated as the low layer. The rest of the system was treated as the high layer. The frequency calculations were conducted at the same level of theory to confirm the nature of stationary points and obtain the thermal corrections. The high-level solution-phase energies of the transition states were calculated with SMD method³ in chloroform. M06-2X functional² with 6-311+(d,p) basis set was used for the high-layer and PM6 method for the low-layer. Intermolecular non-covalent interactions (NCI) in transition states were analyzed by Multiwfn¹⁰ using Independent Gradient Model (IGM).¹¹ The corresponding NCI pictures were generated using VMD.¹²

NCI analysis indicated that the interaction between *tert*-butyl and catalyst is favored. However, if the *tert*-butyl group linked to phosphorous atom is replaced by adamantyl group, the steric effect between catalyst and substrate will be more remarkable. The steric effect destabilizes **TS2**, which is crucial for excellent enantioselectivity.

4. Kinetic resolution research

Some kinetic resolution researches were also detected. As (1) in Scheme 1 showed, the racemic 3d reacted with 20

mmol% $(DHQ)_2PHAL$ for 4 days, and finally we got 51.2:48.8 e.r with the contrary configuration. But when it reacted under $-40^{\circ}C$, we acquired 3d in almost quantitative yield with 50:50 e.r. value (showed as (2)).

And next we added Boc protected substrate 2a to racemic 3d under room temperature as (3) showed, and finally we got 3d with 54.5:45.5 e.r. value with the contrary configuration. When the 2a was changed to 2b, the racemic 3d also produced a 53.0:47.0 e.r. value.

It indicated there is a decompose process accompanied by the generating process of the products with the existence of $(DHQ)_2PHAL$, and this phenomenon facilitated the kinetic resolution process. But when the reaction were happened under low temperature, these processes of decompose and kinetic resolution are absolutely not main controlling factors of the e.r. values.
